INF3480 - Introduction to Robot Operating System

May 5, 2015

Justinas Mišeikis
Let’s Design a Robot
Motors

Encoders

Control Pendant

Robot Controller

Motor controllers

Inverse Kinematics

GUI

Collision Detection

Trajectory Planner

PID Controller

Error Monitoring

Teaching Mode
What a mess!

How can we deal with it?
ROS is an open-source, meta-operating system
ROS is an open-source, meta-operating system.
What’s so special about ROS?

- Reusable robotics components!
- 62 Robotic platforms officially support ROS [http://wiki.ros.org/Robots](http://wiki.ros.org/Robots)
- Modular design
- Hundreds of ready to use algorithms
- Efficient, so it can be used for actual products, not just prototyping
- Runs on Ubuntu, also ARM Processors
- Parallelisation and networking made easy, can use multiple machines simultaneously
A relevant degree is required, for instance in Computer Science or Engineering. A background in Robotics/Computer Vision is desirable, while knowledge of the Robot Operating System (ROS), the Point Cloud Library (PCL), or the Open Source Computer Vision Library (OpenCV) is a big plus.

Goal of this PhD is to study, design and build novel industry-level software based on ROS or ROS-Industry which is modular, reconfigurable, adaptive, easy to use to integrate and control various robotic systems.

The candidate should be knowledgeable about C/C++, ROS and matlab/simulink. Scientific curiosity, large autonomy and ability to work independently are also expected.

The candidate must be a proficient user of C/C++ and ROS and any relevant computer vision library (e.g., ViSP, OpenCV, PCL). Scientific curiosity, large autonomy and ability to work independently are also expected.

*Nice To Haves:*
- Experience with Robot Operating System (ROS).
- Experience with OpenCV and/or PCL.
- Strong background in machine learning.

Required Skills
* MSc in Engineering / Computer Science or equivalent.
* Experience with Robotics
* Knowledge about ROS (Robot Operating System) and CV.
* Advanced experience with C++ and soft real-time programming.
* Team spirit and ability to work independently.
* Excellent communication skills, flexibility and creativity.
Let’s see how it works!

“Plumbing”
Nodes

Nodes are processes that perform computation, “executables”
Topics

Topics are streams of data with publish / subscribe semantics. They are uniquely identifiable by its name.
Services

Request / reply is done via services, which are defined by a pair of message structures: one for the request and one for the reply.
Messages

A message is simply a data structure, comprising typed fields. Language agnostic data representation. C++ can talk to Python.

File: pos.msg
string robotName
uint32 posX
uint32 posY
uint32 goalX
uint32 goalY
The ROS Master provides name registration and lookup to nodes. Without the Master, nodes would not be able to find each other, exchange messages, or invoke services.
Example System - Mobile Robot

Green - Sensors
Blue - Planning algorithms
Red - Hardware integration
“Tools”
System Visualisation: rqt_graph
Live Plotting: rqt_plot
Logging and Visualization Sensor Data: rosbag and rqt_bag
3D Visualisation: RVIZ
“Capabilities”
“Ecosystem”
Worldwide User Base
Number of Robots Supporting ROS
Technical Capabilities

- Motion Planning
  - Fast and good quality paths
  - Kinematic Constraints
- Fast and flexible collision checking
- Integrated Kinematics
- Integrated Perception for Environment Representation
- Standardised Interfaces to Controllers
- Execution and Monitoring
- Kinematic Analysis
- Simulated Robots
Motion Planning

MoveIt! includes a variety of motion planners:

- Sampling-based motion planners (implementations from [OMPL])
- Search-based motion planners (implementations from SBPL)
- Optimization-based motion planners (CHOMP)
Motion Planning - Constraints

You can specify the following kinematic constraints:

- Position constraints – restrict the position of a link to lie within a region of space
- Orientation constraints – restrict the orientation of a link to lie within specified roll, pitch or yaw limits
- Visibility constraints – restrict a point on a link to lie within the visibility cone for a particular sensor
- Joint constraints – restrict a joint to lie between two values
- User-specified constraints – you can also specify your own constraints with a user-defined callback.
Collision Detection

Flexible Collision Library (FCL) is used.

Types of objects supported:

- Meshes
- Primitive shapes (boxes, cylinders, cones)
- Octomap

40,000 to 80,000 collision checks per second!
MoveIt - Robot Setup Assistant
Movelt Capabilities

Computation of motion plans
How to use it?

To simulate and play around with Universal Robot UR5

1) Have ROS installed (current version: Indigo)
2) Install MoveIt for UR5:
   ○ “sudo apt-get install ros-indigo-ur5-moveit-config”
3) Launch UR5 RViz simulator:
   ○ “roslaunch ur5_moveit_config demo.launch”

That’s it!

How to use it?
Actual Project:

People detection for HMC

Joint Human Detection From Static and Mobile Cameras

Detection Process
Algorithm Diagram
Summary

- ROS is a meta-operating system for robotics
- Provides basic (and many!) algorithms for robotics
- Modular approach allows easy adaptation to hardware changes and both hw and sw updates
- Effective visualisation and simulation tools
- World-wide spread in research and commercial use
- BSD license - open source, free to use!
- Over 60 robot platforms support ROS, and growing!
- Easy to start
- Linux based, best works on Ubuntu
- Easy to parallelise, nodes based approach communicate over TCP and can be synchronised using timestamps for messages
