

Compulsory term paper 1 in ECON3120/4120 Mathematics 2

Handed out: Friday 9 March 2007.

To be handed in on Wednesday 28 March 2007 before 2:00 pm.

Hand in at the department reception, 12th floor.

Further instructions:

- This term paper is **compulsory**.
 - This paper will NOT be given a grade that counts towards your final grade for this course. A possible grade is meant only for your guidance.
 - You must use a preprinted front page, which you will find at http://www.oekonomi.uio.no/info/EMNER/Forside_obl_eng.doc
 - It is important that the term paper is delivered by the deadline (see above). Term papers delivered after the deadline **will not be read or marked.***)
 - All term papers must be delivered at the place given above. You must not deliver your term paper to the course teacher or send it by e-mail. If you want to hand in your term paper **before** the deadline, please contact the department reception on the 12th floor.
 - If your term paper is not accepted as satisfactory, you will be allowed a new attempt with a very short deadline. If you still do not succeed, you will not be permitted to take the exam in this course. You will then be withdrawn from the exam, so that it will not count as an attempt.
- *) If you believe that you have good a reason for not meeting the deadline (e.g. illness), you should discuss the matter with your course teacher and seek a formal extension. Normally, an extension will be granted only when there is a good reason backed by supporting evidence (e.g. a medical certificate).

Problem 1

The function f is defined by

$$f(x) = \ln x + \frac{a}{\sqrt{x}} \quad \text{for all } x > 0,$$

where a is a positive constant.

- Calculate $f'(x)$ og $f''(x)$.
- Find all extreme points of f .

(Cont.)

- (c) Find all inflection points for f .
- (d) Investigate $\lim_{x \rightarrow 0^+} f(x)$ and $\lim_{x \rightarrow \infty} f(x)$. (*Hint:* Remember that $\lim_{x \rightarrow 0^+} x^p \ln x = 0$ for all constants $p > 0$.)
- (e) Calculate $I_b = \int_b^1 (\ln x + \frac{a}{\sqrt{x}}) dx$ for $b > 0$. Does $\int_0^1 (\ln x + \frac{a}{\sqrt{x}}) dx$ converge?

Problem 2

Consider the matrices

$$\mathbf{A} = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 3 & 4 \\ 0 & 1 & 2 \end{pmatrix}, \quad \mathbf{B} = \begin{pmatrix} 0 & 2 & 1 \\ 3 & 1 & 0 \\ 1 & 2 & 3 \end{pmatrix}, \quad \mathbf{C} = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad \mathbf{D} = \begin{pmatrix} 2 & -2 & -4 \\ -5 & 1 & -6 \\ 3 & 1 & 2 \end{pmatrix}.$$

- (a) Calculate \mathbf{AB} , $\mathbf{A} - \mathbf{B}$, and $|\mathbf{A} - \mathbf{B}|$.
- (b) Show that $(\mathbf{A} - \mathbf{B})^{-1} = t\mathbf{D}$ for a suitable value of t .
- (c) Find \mathbf{X} if $\mathbf{BX} = \mathbf{AX} + \mathbf{C}$.

Problem 3

Find that solution of the differential equation

$$\dot{x} = t^3 e^{-x} \sqrt{t^2 + 1}$$

that passes through the point $(t_0, x_0) = (0, 0)$.

Problem 4

The equation system

$$\begin{aligned} e^x uv + 2y \ln v &= e + 2e^2 \\ ye^u - xv &= e^3 \end{aligned}$$

defines u and v as differentiable functions of x and y around the point $(x, y, u, v) = (0, e^2, 1, e)$.

- (a) Differentiate the equation system (that is, calculate the differentials).
- (b) Use the result from (a) to determine the values of u'_x , u'_y , v'_x , and v'_y at the given point.
- (c) Find approximate values of u and v if $x = 0.1$ and $y = e^2$.
