

# Final Exam

## ECON 4310, Fall 2021

1. Do **not** write with pencil, please use a ball-pen instead.
2. Please answer in **English**. Solutions without traceable outlines, as well as those with unreadable outlines **do not** earn points.
3. Please start a **new page** for **every** short question and for every subquestion of the long questions.

Good Luck!

	Points	Max
Exercise A		100
Exercise B		70
Exercise C		40
$\Sigma$		210

Grade: \_\_\_\_\_

**Exercise A:****Ramsey Growth Model (100 points)**

Consider a discrete-time version of Ramsey's growth model. The economy is closed and we consider a representative agent with the following preferences over consumption

$$U = \sum_{t=0}^{\infty} \beta^t u(c_t), \quad (1)$$

where  $c_t$  denotes period  $t$  consumption and  $\beta \in (0, 1)$  is the subjective discount factor. The momentary utility function is of the form

$$u(c_t) = \frac{c_t^{1-\theta} - 1}{1-\theta},$$

with  $\theta > 1$ . Every period the agent earns a wage  $w_t$  (the labor supply is exogenously set to 1 unit), an interest  $r_t a_t$  from her assets holdings and she is subject to the lump-sum tax  $\tau_t$ . In equilibrium, the agent will choose the sequence consumption and asset holdings  $\{c_t, a_{t+1}\}_{t=0}^{\infty}$  to maximize  $U$  subject to the period-by-period budget constraint

$$c_t + a_{t+1} = w_t + (1 + r_t)a_t, \quad (2)$$

for a given  $a_0$ . The agent is atomic and her decisions do not influence aggregate variables, thus she takes the sequence of taxes, wage rates and interest rates as given.

The representative firm demands physical capital  $k_t$  and labor  $n_t$  to produce output  $y_t$  with the Cobb-Douglas technology

$$y_t = k_t^\alpha n_t^{1-\alpha}. \quad (3)$$

The firm is atomic and acts as a price-taking profit maximizer. Capital can be rented at the rental rate  $R_t = r_t + \delta$  (note that the depreciation rate  $\delta$  is the difference between the rental rate and the interest rate) while labor costs  $w_t$ . There is no government expenditure.

The first welfare theorem applies to this economy such that the competitive equilibrium is efficient in the Pareto sense. Thus, we know that the solution to the social planner's problem (which characterizes the Pareto efficient allocation) is equivalent to the competitive market equilibrium. According to the social planner's solution, the same consumption Euler equation and resource constraint (goods market clearing) along with the so-called transversality condition (which stands in for the no-Ponzi condition)

$$\begin{aligned} \frac{c_{t+1}}{c_t} &= [\beta(1 + r_{t+1})]^{1/\theta} = [\beta(1 + \alpha k_{t+1}^{\alpha-1} - \delta)]^{1/\theta} \\ k_{t+1} - k_t &= k_t^\alpha - \delta k_t - c_t \\ \lim_{t \rightarrow \infty} \beta^t c_t^{-\theta} k_{t+1} &= 0 \end{aligned}$$

determine the optimal solution of the dynamic system. We can define two correspondances: One characterizes all possible combinations of  $(c_t, k_t)$  when consumption is constant,

$$\mathcal{C}_1(k) \equiv \left\{ c \in [0, \infty) : c_{t+1}/c_t = \left[ \beta(1 + \alpha k^{\alpha-1} - \delta) \right]^{1/\theta}, c_{t+1} = c_t = c \right\},$$

and one captures all combinations if the physical capital stock is constant,

$$\mathcal{C}_2(k) \equiv \{ c \in [0, \infty) : c = k_t^a - (k_{t+1} - (1 - \delta)k_t), k_{t+1} = k_t = k \}.$$

- (a) (15 points) Draw the two correspondances,  $\mathcal{C}_1(k)$  and  $\mathcal{C}_2(k)$ , in a diagram with  $k$  on the horizontal axis and  $c$  on the vertical axis, the so called phase diagram.
- (b) (10 points) Comment on the unique point in the phase diagram where the two correspondances intersect.
- (c) (15 points) Using the phase diagram, illustrate in what direction  $(c_t, k_t)$  will move (in all areas of the  $(c, k)$ -space).
- (d) (15 points) Sketch (we do not know the precise shape at this stage) the saddle path leading to the steady state. Explain why any initial consumption off the saddle path cannot be an equilibrium.

Assume that the economy is in a stationary equilibrium in period  $t_0$ .

- (e) (15 points) Consider an unexpected and temporary increase of  $\Delta\delta > 0$  in depreciation rate from period  $t_0$  until period  $t_1 = t_0 + 1$ . Sketch the dynamics of consumption and physical capital back to the steady-state in the phase diagram. Sketch the time path of the wage rate and interest rates.
- (f) (15 points) Consider an unexpected and temporary increase of  $\Delta\delta > 0$  in depreciation rate from period  $t_0$  until period  $t_1 = t_0 + T, T > 1$ . Sketch the dynamics of consumption and physical capital back to the steady-state in the phase diagram. Sketch the time path of the wage rate and interest rates.
- (g) (15 points) Consider an unexpected and permanent increase of  $\Delta\delta > 0$  in depreciation rate for all future periods  $t \geq t_0$ . Sketch the dynamics of consumption and physical capital to the new steady-state in the phase diagram. Sketch the time path of the wage rate and interest rates.

**Exercise B:****A Social Security (70 points)**

---

Consider a household that potentially lives for two periods. Let  $p$  denote the probability that she survives to the second period. Her utility function is given by

$$2\sqrt{c_1} + p2\sqrt{c_2}$$

where  $c_1$  is first period consumption and  $c_2$  is second period consumption if the household is alive in the second period. The household has income  $y_1 = 60,000$  in the first period of life, but no labor income in the second period of life. Thus the budget constraints read as

$$\begin{aligned}c_1 + s &= 60,000 \\ c_2 &= (1 + r)s\end{aligned}$$

---

- (a) (10 Points) Solve the household's maximization problem for optimal consumption and savings, as functions of the interest rate  $r$  and the probability of survival  $p$ , that is, determine  $c_1(r, p)$ ,  $c_2(r, p)$ ,  $s(r, p)$ .
- 

- (b) (20 Points) What happens to  $c_1(r, p)$  and  $c_2(r, p)$  when the gross real interest rate  $(1 + r)$  increases. Relate your answer to the income, substitution and human wealth effects.
- 

- (c) (10 Points) Suppose that  $p = 0$ . What are the optimal consumption and savings choices? Explain.
- 

- (d) (10 Points) Now the government introduces a social security system of the following form. In the first period, everybody pays a payroll tax rate of  $\tau = 10\%$ . In the second period those that are alive get social security benefits  $b$ . The budget constraint of the government reads as

$$pb = \tau 60,000 = 6000$$

so that

$$b = \frac{6000}{p}$$

Repeat question (a)

---

- (e) (10 Points) Suppose that  $p = 0.1$  and  $r = 0.3$ . Would you rather live in a world with or without social security?
- 

- (f) (10 Points) Give a general condition on  $(r, p)$  such that the household strictly prefers to live in a world with, rather than without social security.
-

**Exercise C:****The Solow Model (40 points)**

---

Consider an economy that is described by the Solow growth model. The output is produced with the following production function:  $Y_t = K_t^{\frac{1}{3}}(A_t L_t)^{\frac{2}{3}}$ , where  $K_t$  is the amount of capital, and  $L_t$  is the amount of labour used in production in period  $t$ .  $A_t$  is the labour-augmenting productivity that grows at rate  $g = 0.02$ , while the population grows at rate  $n = 0.01$ . Capital depreciation rate is equal to  $\delta = 0.1$ .

---

- (a) (10 Points) Suppose the savings rate is equal to  $s$ . Find the steady state in this economy. What happens to the capital per capita, output per capita and consumption per capita in the steady state?

- 
- (b) (10 Points) Compute the steady state wage rate,  $w_t$ , and the rental rate of capital,  $r_t$ , (the interest rate of this economy will be  $r_t - \delta$ ) in this economy.

- 
- (c) (10 Points) Find the golden rule level of capital per effective worker. Find the savings rate that would lead to this level of capital per effective worker in the steady state,  $s_g$ .

- 
- (d) (10 Points) Suppose that the economy starts in the steady state that corresponds to  $s = s_g$ , but a large natural disaster destroys 10% of the total capital stock. What will happen in the short and the long run?
