

UiO : Faculty of Mathematics and Natural Sciences
University of Oslo

Department of Informatics
Networks and Distributed Systems (ND) group

IN 3230 / IN 4230

Networks

Organizational matters

- Physical attendance
  - 1 two-hour lecture per week
  - 1 two-hour plenary session (Øvelser), starting in 2 weeks (3. 9. 2024)
  - 1 common group exercise (Orakel) per week, starting in 3 weeks (11. 9. 2024)

- Theoretical knowledge
  - IN 3230: 70% of the grade
  - IN 4230: 60% of the grade
  - examined in a written 4-hour exam

- Practical knowledge
  - 1 mandatory assignment (must be passed for admission to written exam)
  - IN 3230: 1 home exam (30% of the final grade)
  - IN 4230: 2 home exams (40% of the final grade)

Course outline

Pensum

- All lectures
- All lecture slides
- All group lessons
- All mandatory assignments and home exams

Not pensum

- The recommended books

- **What does that mean?**
  - The books are recommended to improve understanding of the material that is pensum.
  - The books contain more topics.
    These are not part of the course's pensum.
  - In a few cases, the lecture is more up-to-date than the books.

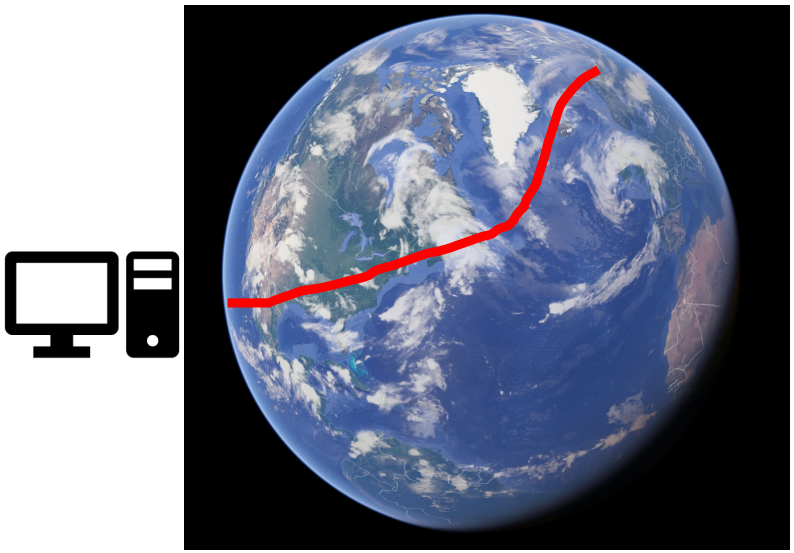

Problem area and focus

- What today's networks really are like
  - Why they are the way they are
  - How we could make them better

→ Critical thinking!

- Principles, concepts, and generality ...and learning by doing
  - Understand principles and concepts by building examples

Internet, previously:

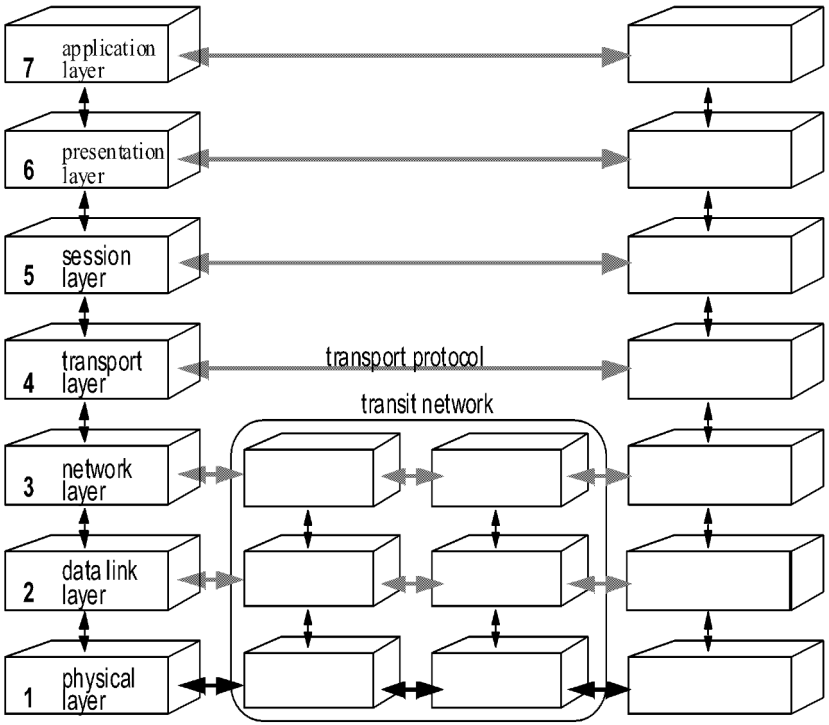

Internet, today:

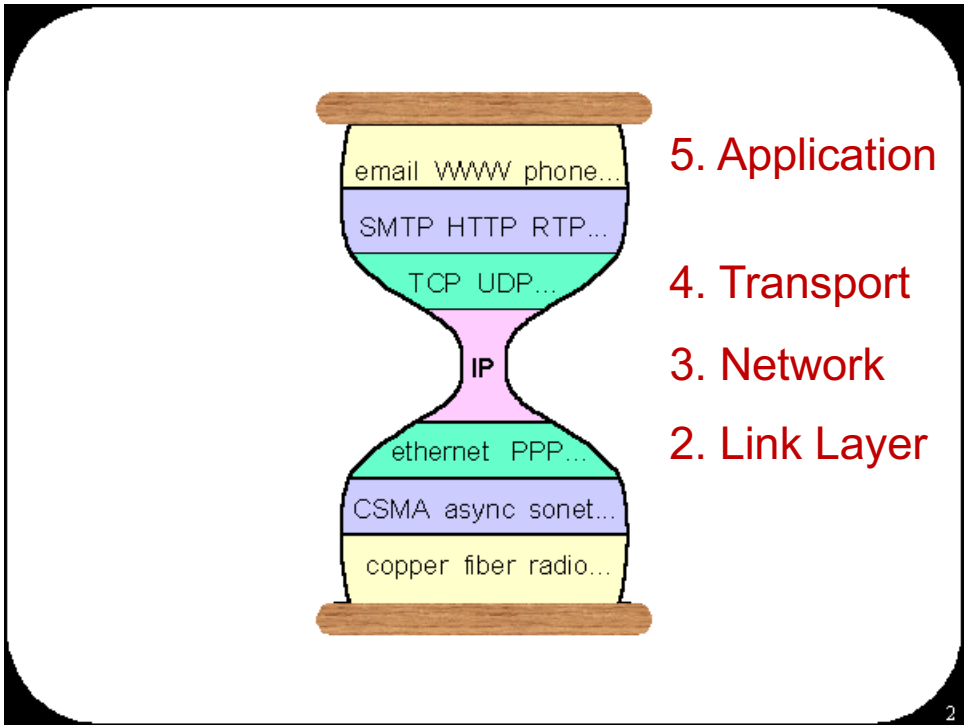

Try it! For example, try google.com… or speedtest.net:
https://stefansundin.github.io/traceroute-mapper/

Theory

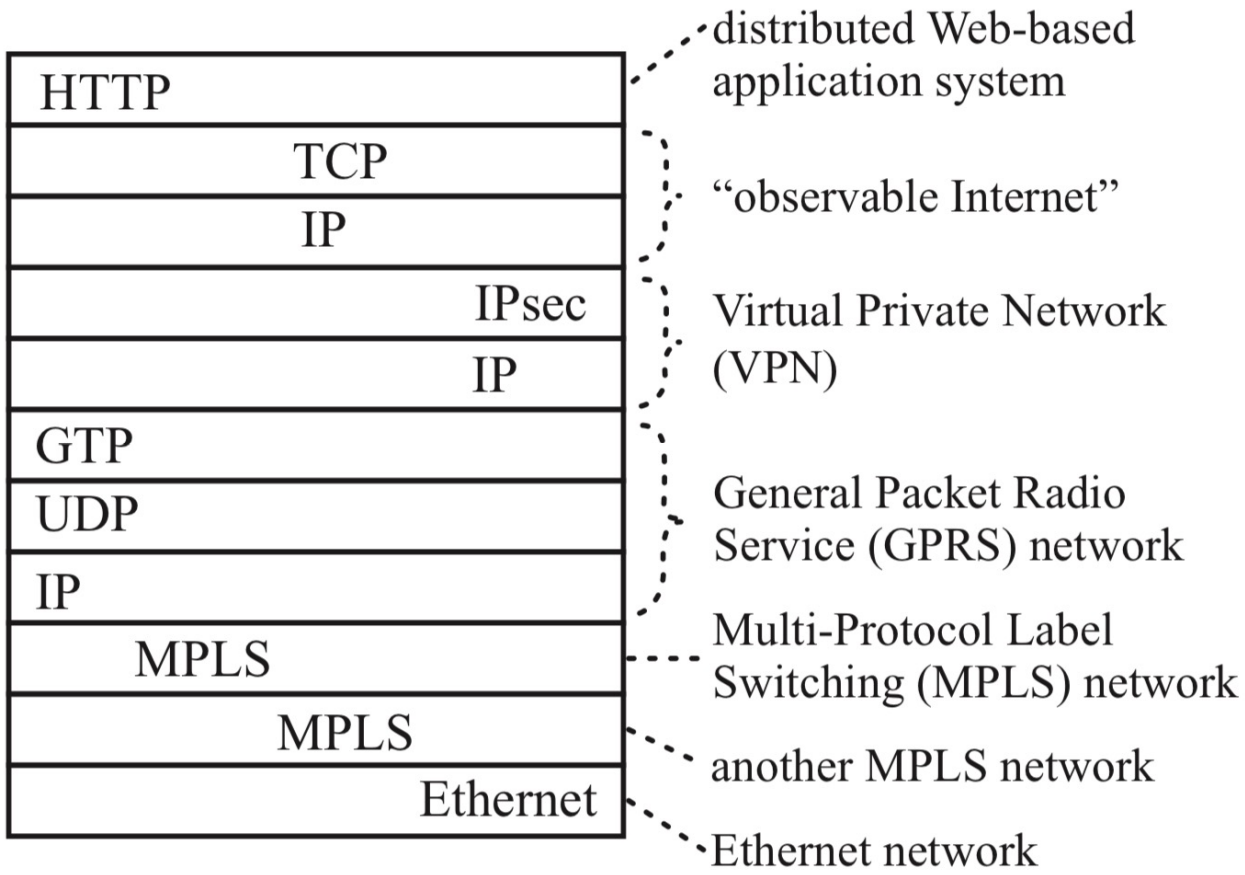

ISO/OSI model

DoD model

Reality

Typical packet from AT&T backbone network

Pamela Zave and Jennifer Rexford. 2019. The compositional architecture of the internet. Commun. ACM 62, 3 (February 2019), 78-87. DOI: https://doi.org/10.1145/3226588

Example problem with Internet layers: multi-path transfer

- TCP makes many assumptions
  (little re-ordering, almost no loss, ..)
  - IP tries to be neutral; yet, new in-network mechanisms must not break TCP's assumptions
- Multi-path data transfer
  - Network layer; routers should not look at transport header
  - Per-packet operation creates re-ordering for TCP
  - Mechanisms like Equal-Cost Multi-Path (ECMP) or Link Aggregation Group (LAG) divide per-connection
  - Need to track connections, need functions per transport protocol
  - IPv6 flow label could help... but ECMP/LAG rules in RFCs allow hashing on transport header

Non-technical reasons for Internet problems

- Compromises
  - Standards: often "group 1 demands X, group 2 demands Y, so let's have both X and Y !"

- Opposing incentives
  - Google, Cisco, Netgear, Akamai, Telenor, Apple, Microsoft, ...

Common open interfaces?

By the way… the IT world is not only AI !

- Below: some names of companies that have participated in the July 2024 meeting of the Internet Engineering Task Force (IETF)
  - and want your network know-how!

Akamai, Apple, Bell, Cloudflare, Cisco, Deutsche Telekom, Ericsson, Fastly, Google, Juniper Networks, Meta, Microsoft, Mozilla, Netflix, NEC, Nokia, Prime Video, Telefonica, Telenor, TikTok, Switch, Verizon, Vodafone

Excerpts from the qualification list in a Netflix job announcement

- Extensive experience in designing, implementing, debugging, and deploying kernel-resident network stacks.

- Deep understanding of strategies implemented in modern TCP and/or QUIC stacks for balancing network congestion, goodput, latency and reliability in support of SVOD (streaming video on demand) applications.

- Experience with the implications for SVOD transport streams of policers & shapers, bufferbloat, active/smart queue management, and highly variable path characteristics.

Conclusion

- The Internet is quite different from “theory”
  - Layers are often neither OSI nor DoD
  - Not much real theory until quite recently
    - Recursive architectures offer a "cleaner" look
- You will learn what the Internet really is like
  - You should learn to appreciate good vs. bad design
  - Hopefully deeper understanding than public press or some tech blogs!

Thank you!
