

The Movie Database

[ORM version]

Ellen Munthe-Kaas

April 2010

The following is a slightly shorter version in English of a document written in conjunction with the mandatory exercises in INF3100.

Background

The test database to be used in the mandatory exercises is a version of the Internet Movie Database (*imdb*) [1], which is a large database containing information on approximately 700000 films and 60000 TV series, 1.7 million persons related to the films, descriptions of the films etc¹. The database runs on Postgres.

History

A first version containing a subset of the films was realized in 2002² on Sybase ASE 11.9.2. Later the department migrated to Oracle. In 2007 the department decided to migrate to Postgres; in connection with this we have decided to include a more or less full version of *imdb*.

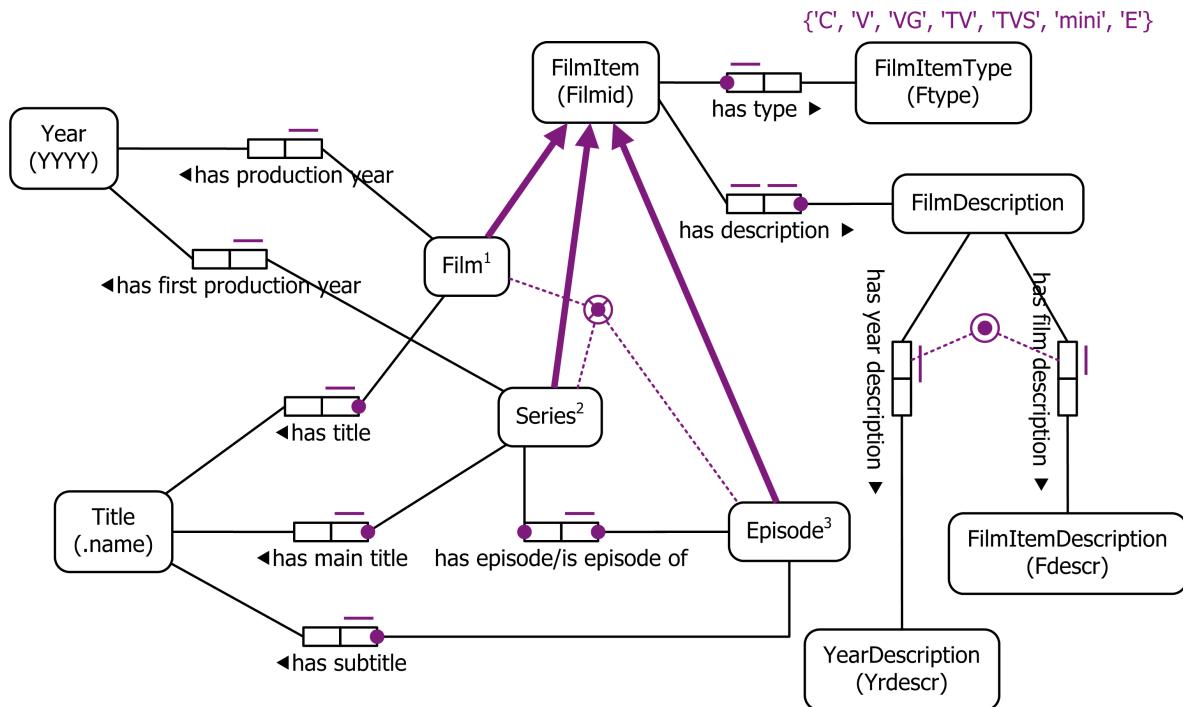

Design of the 2007 Version

Films and TV Series

The 2007 version of the database contains ordinary cinema films as well as TV films and series etc. *FilmItem* contains all kinds of "films", from ordinary cinema films to episodes in TV series. For each collection of episodes that make up a series, *FilmItem* in addition contains an item that represents the series as such, and which can be used to find the title of the series.

¹ April 2007.

² The primary force behind the 2002 database was Igor Rafienko. David Ranvig converted *imdb* files to SQL insert sentences. Rune Aske assisted in testing the *imdb* mirror.

¹each Film is a FilmItem that has type FilmItemType in {'C', 'V', 'VG', 'TV'}

²each Series is a FilmItem that has type FilmItemType in {"TVS', 'mini'}

³each Episode is a FilmItem that has type FilmItemType in {'E'}

Figure 2: FilmItem and its subconcepts

FilmItem types:

C	ordinary cinema film
V	video film
VG	video game
TV	TV film
TVS	TV series
mini	mini TV series
E	episode in a TV series or a mini TV series. The corresponding occurrence in Series has type TVS or mini.

filmdescription contains some additional information for some of the filmitems.

```

create table filmitem (
    filmid int primary key,
    filmtype varchar(4) not null
);

create table film (
    filmid int primary key references filmitem (filmid),
    title text not null,
    prodyear int
);

create index filmtitleindex on film (title);
create index filmyearindex on film (prodyear);
  
```

```
create table filmdescription (
    filmid int primary key references filmitem (filmid),
    year text,
    filmdescr text,
    check (year is not null or filmdescr is not null)
);

create table series (
    seriesid int primary key references filmitem (filmid),
    maintitle text not null,
    firstprodyear int
);
create index seriesmaintitleindex on series (maintitle);

create table episode (
    episodeid int primary key references filmitem (filmid),
    seriesid int not null references filmitem (filmid),
    subtitle text not null,
    foreign key (seriesid) references series (seriesid)
);
```

Additional Film Information

For some films alternative titles (AlternativeFilmTitle), production country (FilmCountry), and language (FilmLanguage) exist. Some films contain some additional information about the language (FilmLanguageInfo). A film can belong to one or more genres (FilmGenre). RunningTime contains the length of the film when run in different countries, potentially with some additional information (RunningTimeInfo). imdb allows the audience to vote (points between 1 and 10) for films, this is included in FilmRating. Distribution contains how the votes distribute over the points given. Some films are assigned a rank based on this.

Distribution is a 10-character string.

1. character: How many voted 1 point (lowest score)
2. "-"- 2 points
- ...
10 "-"- 10 points (best score)

The characters are interpreted as follows:

".	no votes
"0"	1-9%
"1"	10-19%
...	
"9"	90-99%
"*"	100%

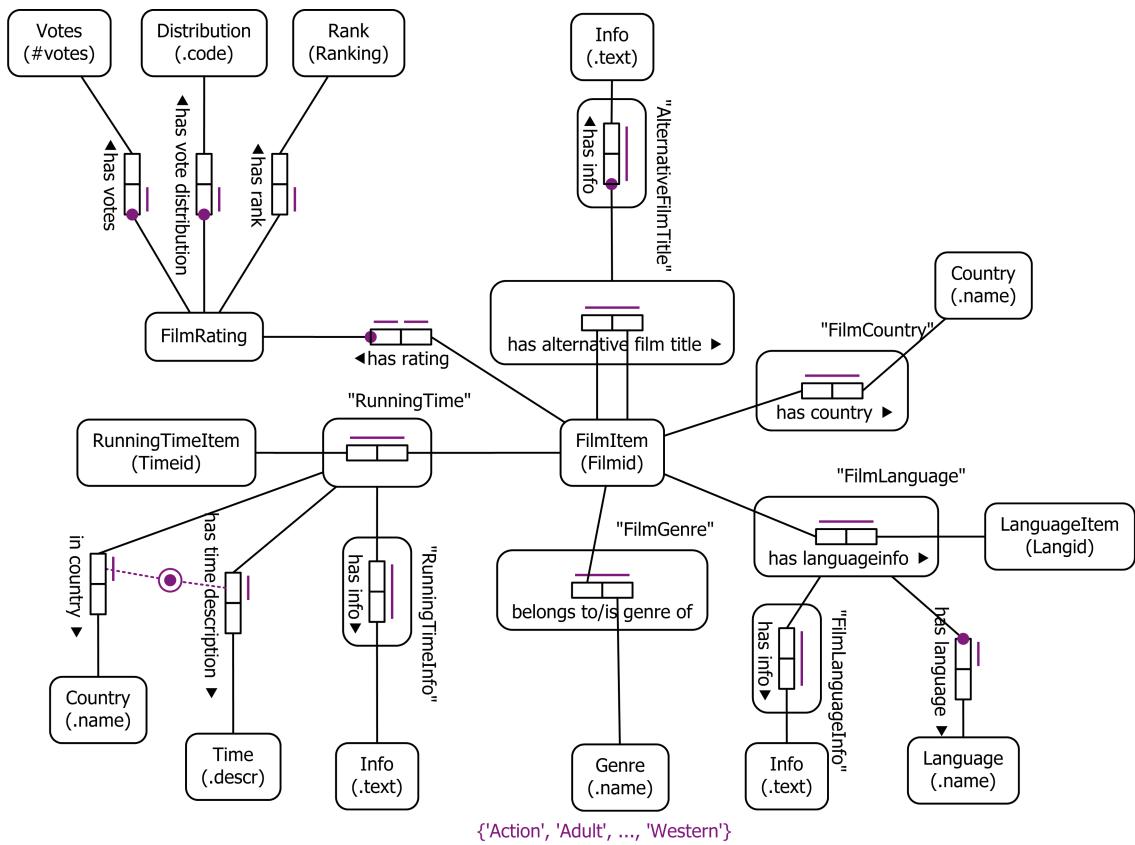

Figure 3: Additional film information

```

create table alternativefilmttitle (
    filmid int references filmitem (filmid),
    akaid int references filmitem (filmid),
    info text not null
);

create index alternativefilmttitlefilmidindex
    on alternativefilmttitle (filmid);
create index alternativefilmtitleakaidindex
    on alternativefilmttitle (akaid);

create table filmcountry (
    filmid int references filmitem (filmid),
    country text,
    primary key (filmid, country)
);

create index filmcountryfilmidindex on filmcountry (filmid);

create table country (
    country text primary key
);

create table filmlanguage (
    filmid int references filmitem (filmid),
    langid int,
    language text not null,
    primary key (filmid, langid)
);
create index filmlanguagefilmidindex on filmlanguage (filmid);

```

```
create table filmlanguageinfo (
    filmid int not null,
    langid int not null,
    info text not null,
    foreign key (filmid, langid) references filmlanguage (filmid, langid)
);

create index filmlanguageinfofilmidlangidindex
    on filmlanguageinfo (filmid, langid);

create table language (
    language text primary key
);

create table filmgenre (
    filmid int references filmitem (filmid),
    genre text,
    primary key (filmid, genre)
);

create index filmgenrefilmidindex on filmgenre (filmid);
create index filmgenregenreindex on filmgenre (genre);

create table genre (
    genre text primary key
);

create table runningtime (
    filmid int references filmitem (filmid),
    timeid int,
    time text,
    country text,
    primary key (filmid, timeid),
    check (time is not null or country is not null)
);

create index runningtimefilmidindex on runningtime (filmid);

create table runningtimeinfo (
    filmid int not null,
    timeid int not null,
    info text not null,
    foreign key (filmid, timeid) references runningtime (filmid, timeid)
);
create index runningtimeinfotimeidindex on runningtimeinfo (filmid,
timeid);

create table filmrating (
    filmid int primary key references filmitem (filmid),
    votes int not null,
    distribution char(10) not null,
    rank float(3)
);
```

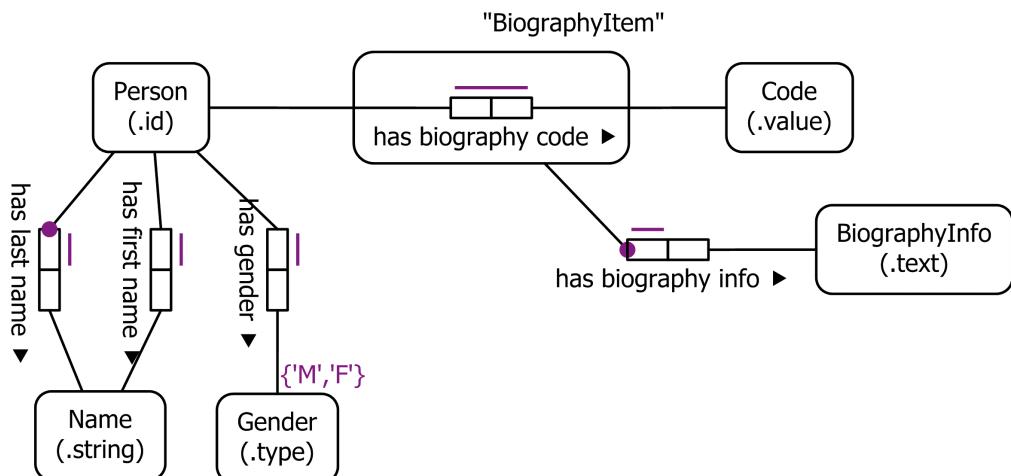

Figure 4: Person

Persons

All persons have a family name, and mostly also a first name. Gender is only present for some persons. `hasFirstName` includes first and middle names. In `BiographyItem` are placed fairly long texts under a number of different codes, e.g.:

- RN: Real name
- TR: Trade
- DB: Date of birth
- DD: Date of death
- NK: Nickname
- BG: Background
- BY: Biographer
- SP: Spouse
- HT: Height
- OW: Other work
- CV: Curriculum vitae
- QU: Quotations

```

create table person (
    personid int primary key,
    lastname text not null,
    firstname text not null,
    gender char(1),
    check (gender = 'M' or gender = 'F');
);

create index personlastnameindex on person (lastname);

create table biographyitem (
    personid int references person (personid),
    code char(2),
    description text not null,
    primary key (personid, code)
);
  
```

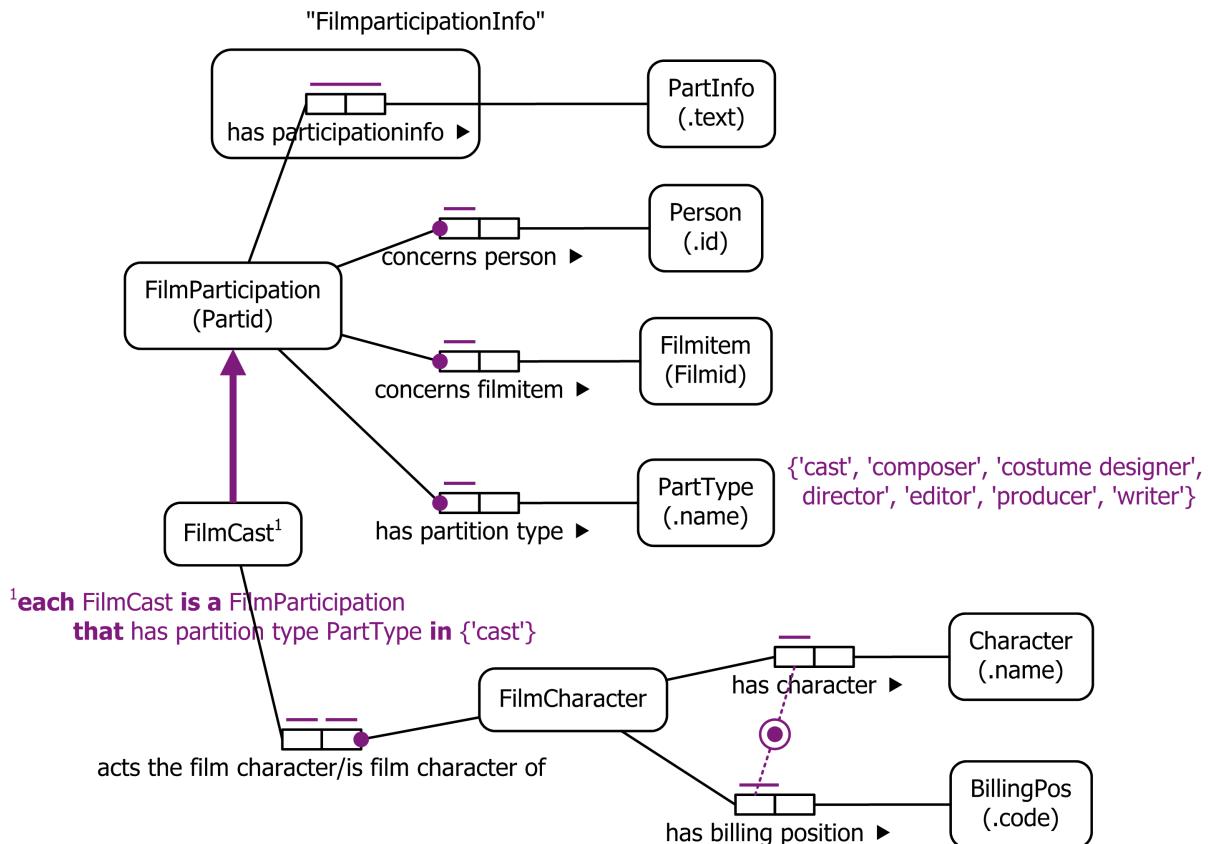

Figure 5: Filmparticipation

Filmparticipation

Persons can participate in films as `cast`, `composer`, `costume designer`, `director`, `editor`, `producer`, `writer`. Film participation is contained in **FilmParticipation**. Some additional information may be found in **FilmParticipationInfo**.

```

create table filmparticipation (
    partid int primary key,
    personid int not null references person (personid),
    filmid int not null references filmitem (filmid),
    parttype text not null
);

create index filmparticipationpersonidindex
    on filmparticipation (personid);
create index filmparticipationfilmidindex
    on filmparticipation (filmid);

create table filmcharacter (
    partid int primary key references filmparticipation (partid),
    filmcharacter text,
    billingpos int,
    check (filmcharacter is not null or billingpos is not null)
);

```

```
create table filmparticipationinfo (
    partid int not null references filmparticipation (partid),
    info text not null
);

create index filmparticipationinfopartidindex
    on filmparticipationinfo (partid);
```

Examples

Luc Besson's participation in the film The Fifth Element:

```
username=> select x.partid, x.personid, x.filmid, x.parttype
username-> from filmparticipation x, person p, film f
username-> where
username->     p.lastname = 'Besson' and
brukeranvn->     p.firstname = 'Luc' and
username->     f.title = 'Fifth Element, The' and
username->     x.personid = p.personid and
username->     x.filmid = f.filmid;
username->     partid | personid | filmid | parttype
-----+-----+-----+-----
 781285 |     89222 | 237127 | director
1009544 |     89222 | 237127 | writer
1009560 |     89222 | 237127 | writer
1009576 |     89222 | 665467 | writer
1009592 |     89222 | 665467 | writer
(5 rows)
```

username=>

Milla Jovovich's roles in The Fifth Element:

```
username=> select filmcharacter
username-> from filmcharacter
username-> where partid = 19580594 or partid = 19580610;
filmcharacter
-----
Leeloo
Leeloo
(2 rows)
```

username=>

Additional information about these roles:

```
username=> select partid, info
username-> from filmparticipationinfo
username-> where partid = 19580594 or partid = 19580610;
partid | info
-----+-----
19580610 | voice
(1 row)
```

username=>

The reason why there are two filmids for The Fifth Element, is that there is a VG version of the film:

```
username=> select f.filmid, title, prodyear, filmtype
username-> from film f, filmitem i
username-> where
username->   f.title = 'Fifth Element, The' and
username->   f.filmid = i.filmid;
filmid |      title      | prodyear | filmtype
-----+-----+-----+
237127 | Fifth Element, The |    1997 | C
665467 | Fifth Element, The |    1998 | VG
(2 rows)
```

```
username=>
```

All roles played by Milla Jovovich:

```
username=> select f.title, c.filmcharacter
username-> from filmparticipation x, person p, film f, filmcharacter c
username-> where
username->   x.parttype = 'cast' and
username->   p.lastname = 'Jovovich' and
username->   p.firstname = 'Milla' and
username->   x.personid = p.personid and
username->   x.filmid = f.filmid and
username->   x.partid = c.partid;
          title           |   filmcharacter
