INF3580/4580 - Semantic Technologies - Spring 2017

Lecture 15: Publishing RDF Data on the Web

Leif Harald Karlsen

22nd May 2017

DEPARTMENT OF INFORMATICS

University of Oslo

Repetition

- 29th May is reserved for "Repetition"
- No fixed lecture material
- You, the students, say what you want to hear
- Let us know by Friday (26.05), so we are prepared.
- If he recieves no mail, there will be no repretition.
- So drop a mail to martingi@ifi.uio.no.

Today's Plan

- Relevant highlights from RDF lecture
- 2 Linked (Open) Data
 - Examples
- S Linking RDF to HTML
- 4 RDFa
- Conclusion

Outline

- Relevant highlights from RDF lecture
- 2 Linked (Open) Data
 - Examples
- 3 Linking RDF to HTML
- 4 RDFa
- Conclusion

RDF

- Why URIs?
 - URIs naturally have a "global" scope, unique throughout the web.
 - URLs are also addresses.
 - "A web of data."
- Why triples?
 - Any information format can be transformed to triples.
 - Relationships are made explicit and are elements in their own right
 - Again, "A web of data".

RDF on the web: Where is it?

- In files:
 - In some serialisation format: XML/RDF, Turtle, . . .
 - Typically small RDF graphs, i.e., max. a few 100 triples, e.g.,
 - Vocabularies: http://xmlns.com/foaf/spec/index.rdf.
 - Tiny datasets: http://folk.uio.no/martingi/foaf.rdf.
- "Behind" SPARQL endpoints:
 - Data kept in a triple store, i.e., a database.
 - RDF is served from endpoint as results of SPARQL queries.
 - Exposes data (in different formats)
 - with endpoint frontends, e.g., http://dbpedia.org/resource/Norway, or
 - by direct SPARQL query: http://dbpedia.org/sparql.

Publishing RDF on the web

- If URIs of resources are dereferencable...
- ... clients can use URIs to request a description of the resource.
- Make data available in different formats. Typically:
 - HTML for humans,
 - RDF for computers.
- This is called *content negotiation*.
- Endpoint frontends will do all of this for you.
- In this lecture, we look at some of the technicalities.

Outline

- Relevant highlights from RDF lecture
- 2 Linked (Open) Data
 - Examples
- 3 Linking RDF to HTML
- 4 RDFa
- Conclusion

URIs

- URIs in RDF can have many different forms:
 - http://www.google.com/ a web page
 - mailto:jsmith@example.com a mailbox
 - http://dbpedia.org/resource/Oslo a town
 - http://folk.uio.no/martingi/foaf#me a person
 - tel:+47-22855050 a telephone line
 - urn:isbn:0-395-36341-1 a book
- Two basic types
 - "information resources": downloadable documents.
 - "non-information resources": other entities.

The Problem and Two Solutions

- The problem:
 - Need to locate information about a resource.
 - The same URI cannot denote a downloadable resource.
- Example: Need to differentiate between:
 - A web page or RDF file about Berlin.
 - The city of Berlin.

- Two W3C-recommended solutions:
 - The hash-namespace solution.
 - The slash-namespace solution (aka HTTP 303 redirects).
- To fully understand them, we need to have a look at HTTP.

HTTP

- HTTP Server listens to "requests" (usually on TCP/IP port 80).
- An HTTP client sends requests to the server and obtains responses.
- A typical request: http://folk.uio.no/martingi/.
 - Connect to port 80 on folk.uio.no.
 - Send:

```
GET /martingi/ HTTP/1.1
User-Agent: Mozilla/5.0 (X11; U; Linux i686; ...
Accept: text/html,application/xhtml+xml,...
Accept-Language: no, en
Host: folk.uio.no
...
```

• Other "methods": HEAD, POST, PUT,...

followed by a blank line.

HTTP (cont.)

A typical response to the GET request:

```
HTTP/1.1 200 OK
Date: Wed, 05 May 2010 14:15:24 GMT
Server: Apache/2.2.14 (Unix) ...
Content-Length: 14348
Content-Type: text/html

<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN"
    "http://www.w3.org/TR/html4/strict.dtd">
<html> ... </html>
```

- Result may vary depending on the Accept: choices in request.
- 200 OK is not the only possible response ("status code"):
 - 404 Not Found
 - 401 Unauthorized
 - 303 See Other

Fragment identifiers

• A fragment identifier is the part after # in a URI:

```
http://en.wikipedia.org/wiki/Fragment_identifier#Examples
http://www.w3.org/1999/02/22-rdf-syntax-ns#type
```

- HTTP specifies that fragment identifiers are processed client-side:
 - GET request is sent without the fragment identifiers:

```
GET /wiki/Fragment_identifier HTTP/1.1
```

- fragment identifier is processed by client.
- For HTML or XHTML:
 - Elements (sections titles, paragraphs, etc.) can have *id* attributes:

```
<h2 id="Examples">Examples</h2>
```

• Browser will jump to element identified by fragment identifier.

Hash namespaces

- For RDF served over HTTP: fragment identifiers identify resources:
 - http://bla.bla/bla#resource is a resource
 - http://bla.bla/bla is a document describing the resource
- e.g., FOAF files:
 - http://folk.uio.no/martingi/foaf.rdf#me a person
 - http://folk.uio.no/martingi/foaf.rdf an RDF/XML file
- By convention the RDF file contains some triples involving resources identified by its fragments.
- Can use the part of the URI until # as namespace

```
@prefix myfoaf: <http://.../martingi/foaf.rdf#>
myfoaf:me foaf:givenname "Martin" .
```

• This is known as a "hash namespace".

Hash namespaces – pros and cons

- Hash namespaces solve our problem:
 - Resources are separate from documents about them.
 - It is possible to find a document given a resource URI.
- Moreover:
 - Fetching the right document is done automatically by HTTP.
 - It is enough to publish the RDF file on an HTTP server.
 - Very low tech and fool proof, in other words.
- However:
 - All data published this way about all entities in a hash namespace needs to be stored in the same RDF file
 - http://brreg.no/bedrifter.rdf#974760673
 - Too tight coupling of URI schema (name design) and physical storage (file name).

HTTP Redirection

- Reminder: HTTP responses start with a "status code":
 - Usually "200 OK", if the document was found and can be served.
 - "404 Not Found", if the document does not exist.
- One of the possible status codes is "303 See Other".
- Always comes with a Location: field in the response.
- Tells the client to submit a "GET" request to that location.
- Also known as "303 redirection".
- Followed by all modern HTTP clients.
- Often used when URIs have changed.

Example of 303 Redirection

• User requests http://www.sun.com/.

Client sends request to www.sun.com:

GET / HTTP/1.1
Host: www.sun.com

• Sun was bought by Oracle. . . Server responds:

HTTP/1.1 303 See Other

Location: http://www.oracle.com/

• Client sends new request to www.oracle.com:

GET / HTTP/1.1

Host: www.oracle.com

Server at www.oracle.com responds:

HTTP/1.1 200 OK

Content-Type: text/html

. . .

303 Redirection for RDF

- Find information about http://dbpedia.org/resource/Oslo.
- Send "GET" request to server dbpedia.org: GET /resource/Oslo HTTP/1.1 Accept: application/rdf+xml
- Server dbpedia.org recognizes this as a non-information resource.
- Redirects to a file with data about the city of Oslo: HTTP/1.1 303 See Other
 Location: http://dbpedia.org/data/Oslo.xml
- Browser can now send a new request for that location: GET /data/Oslo.xml HTTP/1.1

```
Accept: application/rdf+xml
```

• This time the server responds with the requested document:

```
HTTP/1.1 200 OK
Content-Type: application/rdf+xml
```

. .

Slash Namespaces

Common to use URIs with a slash (/) as last non-identifier character:
 http://dbpedia.org/resource/0slo

• Can use URI up to last slash as namespace:

```
@prefix dbpedia: <http://dbpedia.org/resource/>
dbpedia:Oslo dbprop:maySnowCm "0" .
```

- Known as a "slash namespace".
- Advantages over hash namespaces:
 - Whole URI is sent to server, so...
 - Possible to redirect different resources to different documents.
 - Possible to change redirection without changing URIs.
- Requires some more server configuration.
- See recipes at http://www.w3.org/TR/swbp-vocab-pub/.
- See also http://linkeddatabook.com/.

Serving Vocabularies

- What about classes and properties?
- Identified by URIs:

```
http://xmlns.com/foaf/0.1/Person
http://xmlns.com/foaf/0.1/knows
http://www.w3.org/1999/02/22-rdf-syntax-ns#Statement
http://www.w3.org/1999/02/22-rdf-syntax-ns#type
```

- What should be served in response to these?
 - A description of the "vocabulary" defining the term.
 - Often an RDF file with RDFS or OWL/RDF content.
 - Sometimes (FOAF) just an HTML page with documentation.
- Mechanisms are the same as for "ordinary" RDF data.
- A single RDF file (hash namespace) is usually OK.
- Should also serve the vocabulary description for the "vocabulary URI":

```
http://xmlns.com/foaf/0.1/
http://www.w3.org/1999/02/22-rdf-syntax-ns#
```

HTTP Content Type Negotiation

- In HTTP, data formats are identified by "internet media types".
 - Previously known as MIME types.
 - text/html, image/jpeg, application/pdf,...
- RDF media types:
 - RDF/XML: application/rdf+xml.
 - Turtle: text/turtle.
 - N3: text/n3.
- Client sends accepted media types in Accept: header:
 - Accept: text/html, text/plain
- Server chooses sent media type:
 - Picks the preferred one among available types.
 - Sends the media type of the response in the header.
 - Content-Type: text/html

Content Type Negotiation for RDF

- Given the URI of a non-information resource...
 - A semantic web applications wants RDF data, as discussed.
 - A regular WWW browser wants HTML, human readable.
- This can be achieved using HTTP content type negotiation.
- Semantic web client:
 - Requests RDF, e.g., Accept: application/rdf+xml, text/turtle.
 - Server uses e.g., 303 redirection to an RDF file.
- HTML web client:
 - Requests text, e.g., Accept: text/html, text/plain.
 - Server uses e.g., 303 redirection to an HTML file.
- Also possible with hash namespaces, see http://www.w3.org/TR/swbp-vocab-pub/.

Example: dbpedia.org

- Requesting the URI http://dbpedia.org/resource/Oslo
- From an HTML web browser:
 - Sends Accept: text/html in request
 - Server returns:

```
HTTP/1.1 303 See Other
Location: http://dbpedia.org/page/Oslo
```

- Client requests http://dbpedia.org/page/Oslo
- Server sends HTML document:

```
HTTP/1.1 200 OK
Content-Type: text/html
```

Example: dbpedia.org (cont.)

- Requesting the URI http://dbpedia.org/resource/Oslo
- From a semantic web browser:
 - Sends Accept: application/rdf+xml in request
 - Server returns:

```
HTTP/1.1 303 See Other
Location: http://dbpedia.org/data/Oslo.xml
```

- Client requests http://dbpedia.org/data/Oslo.xml
- Server sends RDF/XML document:

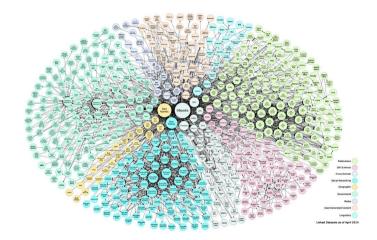

```
HTTP/1.1 200 OK
Content-Type: application/rdf+xml
```

```

INF3580/4580 :: Spring 2017 Lecture 15 :: 22nd May 25 / 50

The Linked Open Data Cloud

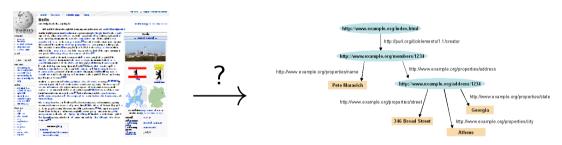

http://lod-cloud.net/

Outline

- Relevant highlights from RDF lecture
- 2 Linked (Open) Data
 - Examples
- 3 Linking RDF to HTML
- 4 RDFa
- Conclusion

The Problem

- The HTML web contains lots of human-readable information
- How can clients discover the location of corresponding machine-readable information?

Embedding RDF/XML in (X)HTML

• First idea: Embed RDF/XML in HTML or XHTML:

- Not recommended:
- Does not fit HTML or XHTML DTDs
- No satisfactory solution, due to flexible RDF vocabulary
- B.t.w. there is a metadata element in SVG for this!

HTML LINK elements

- LINK may occur inside HTML HEAD elements
- relate a document to other documents
 - CSS style sheets
 - Alternative languages
 - Next, previous, index, etc.
- Can contain attributes:
 - rel the kind of relation
 - type the media type of the related document
 - href the URL of the other document
 - title the title of the other document
 - (and some more)
- E.g. a style sheet:

```
<html>
<head>
<title>My Homepage</title>
link rel="stylesheet" type="text/css" href="style.css">
```

LINKing to RDF

• To link to an RDF representation:

```
<LINK rel="alternate"
    type="application/rdf+xml"
    title="RDF/XML version"
    href="http://dbpedia.org/data/Oslo.xml">
```

- Also: rel="meta"
 - Note: difference between meta-data and alternative representation
- Turtle:

```
type="text/turtle; charset=UTF-8"
```

• Various web browser plugins exist to detect these LINKs

HTTP Link: response headers

- Problems with <LINK> elements:
 - Only works with HTML data, not PDF, Images, etc.
 - Need to download HTML content and search LINK.
- Idea: put information in HTTP response header.
- Non-standardized proposal, originally by Berners-Lee, 1992
- Generated by a few servers, recognized by a few clients
- Same information as in LINK HTML element, but as HTTP header:

```
Link: <foaf.rdf>; rel="alternate"; type="application/rdf+xml"
```

- Advantages:
 - can be sent also with non-HTML data
 - requires only HEAD request

Outline

- Relevant highlights from RDF lecture
- 2 Linked (Open) Data
 - Examples
- 3 Linking RDF to HTML
- 4 RDFa
- Conclusion

Once More: Embedding RDF in (X)HTML

- Directly embedding RDF/XML in (X)HTML does not work well
- Use a different "serialization" that blends well with (X)HTML!

```
From the RDFa specification (http://www.w3.org/TR/rdfa-syntax/)
```

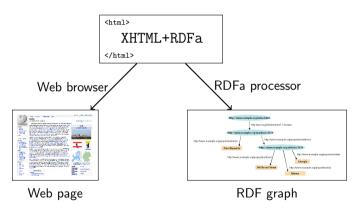

The aim of RDFa is to allow a single RDF graph to be carried in various types of document mark-up.

- XHTML in spec., but works with HTML and other XML
- RDFa adds a fixed set of attributes to (X)HTML
- Document type:

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML+RDFa 1.0//EN"
    "http://www.w3.org/MarkUp/DTD/xhtml-rdfa-1.dtd">
```

RDFa Processing

- Web browsers ignore RDFa attributes
- RDFa processors extract a single RDF graph from a document

RDFa Concepts

- RDFa adds semantic annotations to
 - hyper-links (href)
 - textual content
- RDFa attributes can appear in (almost) any element
- As the XHTML is processed, there is always a "current subject" that generated triples refer to
- The current subject starts as the base URI of the document, but can change on the way

Reminder: (X)HTML Meta and Link

• Links and metadata in HTML header:

```
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>
        <title>Page 507</title>
        <meta name="author" content="Sigrid Undset" />
        link rel="prev" href="page506.html" />
        link rel="next" href="page508.html" />
        </head>
        <body>...</body>
        </html>
```

- Meaning of name and rel informal
- Only a few values defined by the standard

RDFa property and rel

• "semantic" meta and link in RDFa:

```
<html xmlns="http://www.w3.org/1999/xhtml"</pre>
        xmlns:foaf="http://xmlns.com/foaf/0.1/"
        xmlns:dc="http://purl.org/dc/elements/1.1/">
    <head>
      <title>MG's home page</title>
      <meta property="dc:creator" content="Martin Giese" />
      <link rel="foaf:topic" href="foaf.rdf#me" />
    </head>
    <body>...</body>
  </ht.ml>
Extracted triples: (<> is base URI!)
    <> dc:creator "Martin Giese" .
    <> foaf:topic <foaf.rdf#me> .
```

Attribute rel on A elements

• Any hyper-link can be given a "meaning":

```
This document is licensed under a
<a xmlns:cc="http://creativecommons.org/ns#"
    rel="cc:license"
    href="http://creativecommons.org/licenses/by-nc-nd/3.0/">
    Creative Commons License
</a>.
```

• Extracted triple:

```
<> cc:license <http://creativecommons.org/.../3.0/> .
```

• Can use rev instead of rel to swap subject and object:

```
Made by <a rev="foaf:made" href="http://.../foaf#me">me</a>.
```

• Extracted triple:

```
<http://.../foaf#me> foaf:made <> .
```

The property attribute

• rel is for resource objects, property for literal objects:

```
<html xmlns="http://www.w3.org/1999/xhtml"</pre>
        xmlns:dc="http://purl.org/dc/elements/1.1/">
    <head>...</head>
    <body>
      <h1 property="dc:title">Kransen</h1>
      Written in <span property="dc:created">1920</span>
    </body>
  </html>
Extracted triples:
    <> dc:title "Kransen" : dc:created "1920" .
• Can also use content attribute together with property:
  <span property="dc:created" datatype="xsd:dateTime"</pre>
        content="2007-09-16T16:00:00-05:00">
    September 16th at 4pm
  </span>
```

Changing the Subject

about changes subject of contained rel and property annotations:

```
<div about="http://.../foaf.rdf#me"</pre>
      xmlns:foaf="http://xmlns.com/foaf/0.1/">
   Martin Giese
    Email:
     <a rel="foaf:mbox" href="mailto:mg@mail.no">
       mg@mail.no</a>
    Phone:
     <a rel="foaf:phone" href="tel:+47-31415926">
       31 41 59 26</a>
  </div>
Extracted triples:
   <http://.../foaf.rdf#me> foaf:name "Martin Giese" ;
                           foaf:mbox <mailto:mg@mail.no> ;
                           foaf:phone <tel:+47-31415926> .
```

Types and Blank Nodes

- typeof adds an rdf:type triple
- Missing URIs can lead to blank nodes:

Extracted triples:

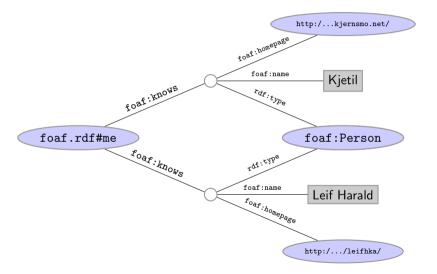

```
[] a foaf:Person ;
  foaf:name "Martin Giese" ;
  foaf:mbox <mailto:mg@mail.no> ;
```

Know Your Friends

Missing objects collected from contained elements (chaining):

```
<div xmlns:foaf="http://xmlns.com/foaf/0.1/"</pre>
    about="foaf.rdf#me" rel="foaf:knows">
 <111>
   <a property="foaf:name" rel="foaf:homepage"</pre>
        href="http://www.kjetil.kjernsmo.net/">Kjetil</a>
   </1i>
   <a property="foaf:name" rel="foaf:homepage"</pre>
        href="http://heim.ifi.uio.no/leifhka/">Leif Harald</a>
   </111>
</div>
```

Triples From Chaining Example

RDFa Summary

- Allows to "hide" an RDF graph in an XHTML document
 - XHTML processor can ignore RDFa
 - RDFa processor can extract RDF graph
- Treat links and text as subjects/objects and literals
- Many, many more details!
 - Specification hardly less complicated than RDF/XML
 - See spec. at http://www.w3.org/TR/rdfa-syntax/
- Nothing you couldn't do with a LINK and an RDF file
- Can be convenient to have information in one place
- Used by Google as one data format for "Rich Snippets" https://developers.google.com/structured-data/
- NOTE: this lecture was about RDFa 1.0. Search the web for RDFa 1.1!

Outline

- Relevant highlights from RDF lecture
- 2 Linked (Open) Data
 - Examples
- Linking RDF to HTML
- 4 RDFa
- Conclusion

Topics Covered

- RDF, principles, Turtle syntax
- The Jena API for RDF
- The SPARQL Query Language
- Basics of the RDFS and OWL ontology languages
- Basics of model semantics and reasoning
- Linked Open Data, RDFa
- Publishing Databases as RDF

Topics Not Covered

- Rule Languages (SWRL, RIF, Jena rules, etc.)
- SW application structures
- Semantic Web Services
- Details of RDF/RDFS model semantics
- Some details of OWL
- Details of OWL 2 profiles
- Logical theory: Soundness, Completeness,...
 - (You ain't seen nothing yet :-)
- And many more!

Help! I Can't Get Enough!

- For more information on theory:
 - Book on Foundations of SW Technologies
 - Take a course in logic or automated reasoning
- For more information on practical questions:
 - Book on Semantic Web Programming
 - Standards texts on W3C Web pages
 - Google
- Still not enough?
 - Contact us for possible MSc topics!
