

## Lecture #5 (F5) 23 February 2006

### Model mappings and transformations

Brian Elvesæter, SINTEF ICT  
[brian.elvesater@sintef.no](mailto:brian.elvesater@sintef.no)

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

## Structure

- Foundations of model mappings and transformations
- Model transformation technologies and examples
- Atlas Transformation Language (ATL) tutorial with RSM example
  - Installation
  - Book2Publish example
  - RSM
- References

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

2

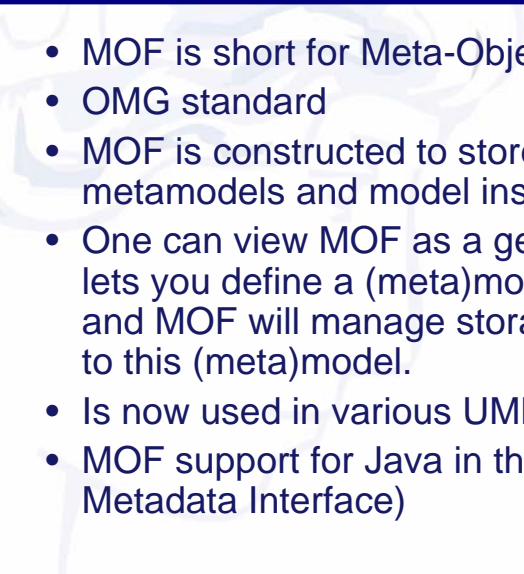

## Foundations of model mappings and transformations

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

3

## About MOF

- 
- MOF is short for Meta-Object Facility
  - OMG standard
  - MOF is constructed to store and manage metamodels and model instances of these.
  - One can view MOF as a generic storage which lets you define a (meta)model of what to store, and MOF will manage storage of data according to this (meta)model.
  - Is now used in various UML tools.
  - MOF support for Java in the form of JMI (Java Metadata Interface)

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

4

## MOF usage

- Core technology for flexible model repositories
  - A commonly used term for denoting a structured storage for information of various kinds.
- Define new metamodels in a standardized way.
- Base technology for different modelling tools (UML).

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

5

## Model mapping (1/2)

- Mapping is performed by defining relations between two models
- The relations can be
  - 1-to-1, n-to-1, 1-to-n or n-to-n
- Mapping is performed in “design time”

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

6

## Model mapping (2/2)

- The mapping is defined with models one meta-level higher than the input and output of the transformation.
- The mapping is used to perform transformation of instances of the mapped models.
- “The mapping describes the rules used for the transformation”.

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

7

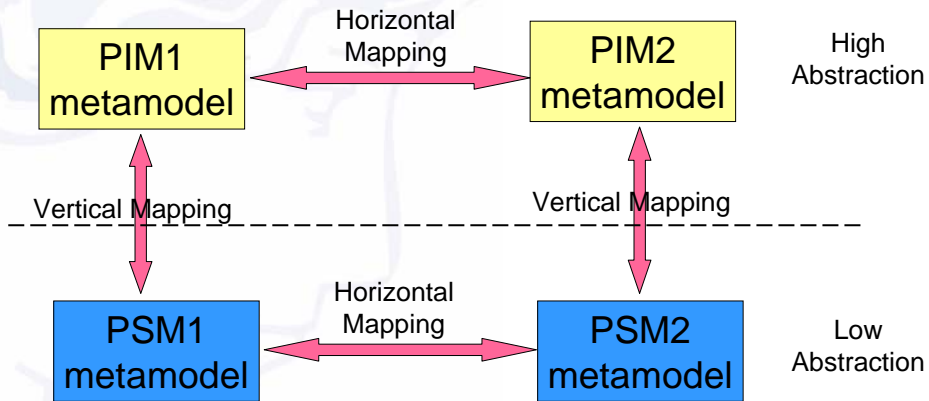

## Mapping and transformation

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

8

## Different mappings

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

9

## Transformations

- Takes input and produces output
  - One-way process
- Transforms according to a predefined mapping
- Transformation is used in “run time”
- Two main categories of transformation
  - Vertical transformation
  - Horizontal transformation

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

10

## Horizontal transformation

- Source model has the same level of abstraction as target model
  - Not to be confused with “meta-levels”
- Examples of horizontal transformation
  - Refactoring
  - Merging

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

11

## Vertical transformation

- Source model is at a different level of abstraction than the target model
- Examples of vertical transformation
  - Refinement (specialization)
    - PIM→PSM transformations
  - Abstraction (generalization)

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

12

## MOF QVT (Query/View/Transformation)

- High-level
  - Definition of query/view/transformation language for MOF
  - Important part of realizing the OMG MDA vision
- Part of the MOF 2.0 specification work in OMG
  - MOF 2.0 Facility / Object Lifecycle RFP
  - MOF 2.0 IDL RFP MOF 2.0 Versioning RFP
  - MOF 2.0 Query / View / Transformation RFP
  - MOF 2.0 Core
- We focus on the transformation part
  - But we will need both the Q and the V for it to work

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

13

## Involved partners

- Codagen
- Compuware
- DSTC
- France Telecom
- IBM
- INRIA
- Interactive Objects
- Kings College London
- Softteam
- Sun Microsystems
- Tata Consultancy Services
- Thales
- TNI-Valiosys
- University of Paris VI
- University of York

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

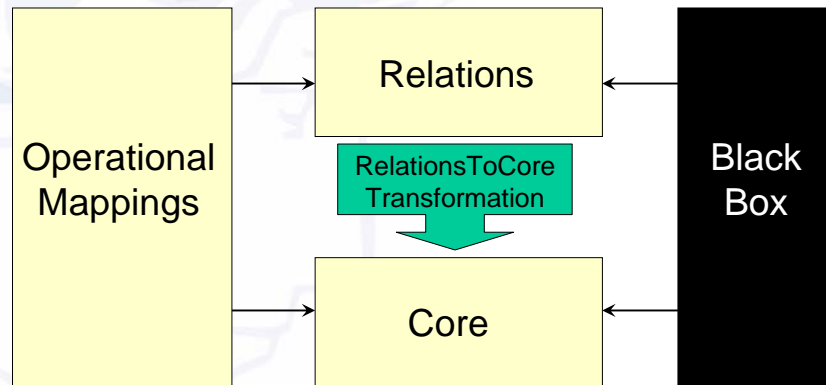

14

- Queries are performed on input models for finding specific elements or information
  - Example: *Return all classes*
- Views are models derived from other models
  - The result of a query is a kind of view
- Transformations takes a model as input and creates a new model
  - Example: PIM → PSM
  - Defined in Relations language or Core language
  - Uses Queries and Views

- The abstract syntax must be defined as a metamodel in MOF
- Concrete syntax expressed as text (program code) or models
- Variations
  - Declarative
  - Imperative

## QVT overview

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

17

## QVT overview – Declarative part

- Relations
  - Declarative specification of the mapping between MOF models
  - Equivalent with Java code (high-level)
- Relations to Core transformation
  - Equivalent with compiling Java code into byte code
- Core
  - Equivalent with Java byte code (low-level)

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

18

## QVT overview – Imperative part

- Operational mappings
  - Standard language for defining Relations (or Core) in an imperative way
- Black box
  - Offers the possibility to plug-in code from any programming language with a MOF binding

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

19

## QVT in practice – most transformation

- Given a defined metamodel for source and target
  - Metamodels must be well-defined according to MOF (models on level M2)
- One can define transformations between these two worlds in a general, standardized manner
  - The transformation can be used on all instances of the source metamodel
  - The result will be an instance of the target metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

20

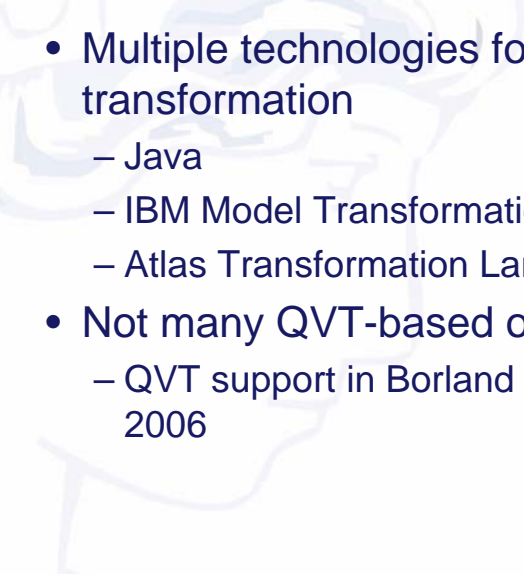

## Model transformation technologies and examples

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

21

## Technology overview

- 
- Multiple technologies for mapping and transformation
    - Java
    - IBM Model Transformation Framework (MTF)
    - Atlas Transformation Language (ATL)
  - Not many QVT-based ones
    - QVT support in Borland Together Architect 2006

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

22

## Java

- Technologies such as MDR and EMF allow for generation of Java API toward arbitrary metamodels
- Using these APIs mappings can be defined in a Java program
- The transformation is performed by running the Java program on a model instance given as input
- Drawback
  - API generation for metamodels needed
- Pros
  - Well known language for mapping definition

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

23

## IBM MTF

- MTF was developed in order to experiment with QVT related concepts
- MTF is not QVT compliant
- MTF rules describe the relationships between the input and the output metamodel
- Provides functionality to define mappings between metamodels
- And execute the model transformations

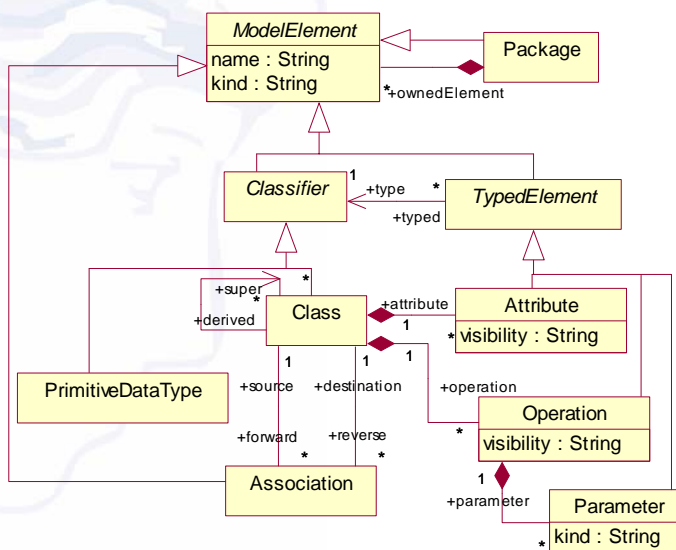

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

24

- The Atlas Transformation Language (ATL) is a hybrid language (a mix of declarative and imperative constructions) designed to express model transformations as described by the MDA approach.
- It is not QVT, but similar and with the corresponding functionality
- A transformation model in ATL is expressed as a set of transformation rules.
- The recommended style of programming is declarative.
- OCL is used to expression constraints on rules
  - Guards (constraints) on the entry point for a rule
- Different kinds of M3/M2 (meta)metamodel technology supported: Netbeans MDR and EMF Ecore
  - Can use either EMF or MDR metamodels as input and output.
- Can also be used to produce textual output.

## Example: UML → RDBMS

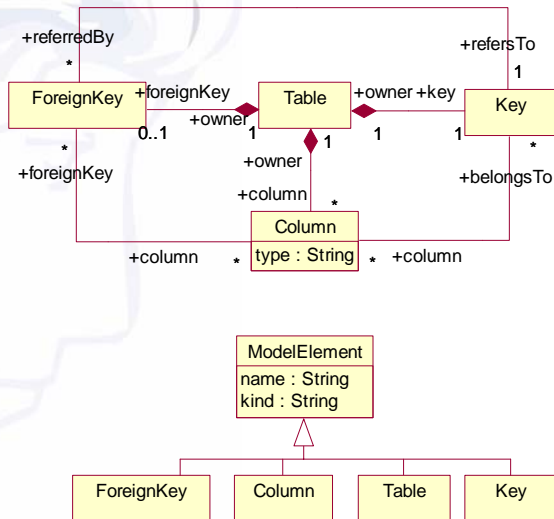

Parts of UML metamodel

## Example: UML → RDBMS

Simple RDBMS  
metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

27

## Example: Informal rules

- A persistent class maps to a table, a primary key and an identifying column.
- Attributes of the persistent class map to columns of the table: an attribute of a primitive datatype maps to a single column; an attribute of a complex data type maps to a set of columns corresponding to its exploded set of primitive datatype attributes; attributes inherited from the class hierarchy are also mapped to the columns of the table.
- An association between two persistent classes maps to a foreign key relationship between the corresponding tables.

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

28

## Example: Java transformation (1/2)

```
public Model model2model(org.eclipse.uml2.Model inModel){
    Model retval = RdbmsFactory.eINSTANCE.createModel();
    Iterator it = inModel.getOwnedElements().iterator();
    while (it.hasNext()){
        Object element = it.next();
        if(element instanceof Class){
            Class toProcess = (Class)element;
            retval.getElements().add(class2table(toProcess));
        }
    }
    return retval;
}

public Table class2table(Class inClass){
    Table retval = RdbmsFactory.eINSTANCE.createTable();
    retval.setName(inClass.getName());
    Iterator it = inClass.getOwnedAttributes().iterator();
    while (it.hasNext()){
        Object attrib = it.next();
        if(attrib instanceof Property){
            Property toProcess = (Property)attrib;
            retval.getColumns().add(attrib2column(toProcess));
        }
    }
    return retval;
}
}
```

29

## Example: Java transformation (2/2)

```
public Column attrib2column(Property inAttr){
    Column retval = RdbmsFactory.eINSTANCE.createColumn();
    retval.setName(inAttr.getName());
    retval.setType(inAttr.getType().getName());
    return retval;
}
```

- It is all about traversing the model tree
  - And building an output model

30

## Example: MTF transformation

```
/* UML Packages map to EPackages */
relate umlpkg2ecore( uml:Package pkg, ecore:EPackage epkg)
  when equals(pkg.name, epkg.name)
{
  // map sub-packages
  umlpkg2ecore( over pkg.ownedMember, over epkg.eSubpackages),

  // map classifiers
  umlclassifier2ecore( over pkg.ownedMember, over epkg.eClassifiers )
}

/* UML Classifiers map to EClassifiers */
abstract relate umlclassifier2ecore( uml:Classifier class,
  ecore:EClassifier eclass)
  when equals(class.name, eclass.name)

/* Map UML Class to EClass */
relate umlclass2ecore extends umlclassifier2ecore( uml:Class class,
  ecore:EClass eclass)
{
  // check that super classes map to each other
  check umlclass2ecore(over class.superClass, over eclass.eSuperTypes)
}
```

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

31

## Example: ATL transformation (1/2)

```
module uml2rdbms; -- Module Template
create OUT : rdbms from IN : uml2;

rule model{
  from inMod:uml2!Model
  to
  modi:rdbms!Model(
    elements <-inMod.ownedMember
  )
}

rule class2table{
  from cl:uml2!Class (cl.oclcIsTypeOf(uml2!Class))
  to
  tbl:rdbms!Table(
    name <- cl.name,
    columns <- cl.ownedAttribute
  )
}
```

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

32

## Example: ATL transformation (2/2)

```
rule attr2col{
  from attr:uml2!Property
  to
    col:rdbms!Column(
      name <- attr.name,
      type <-attr.type.name
    )
}
```

- Compared to Java ATL provides simpler mechanisms for model traversal

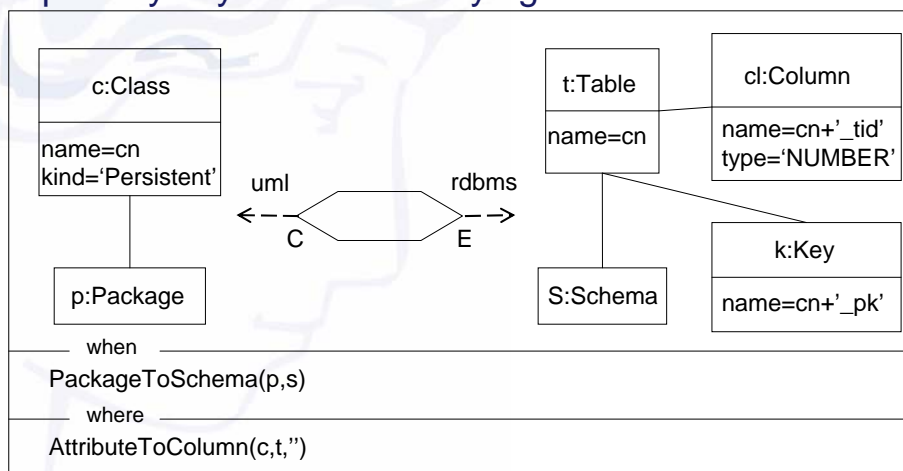

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

33

## Example: QVT graphical notation

A persistent class maps to a table,  
a primary key and an identifying column

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

34

## Example: QVT textual notation

A persistent class maps to a table,  
a primary key and an identifying column

```
top relation ClassToTable {
  cn, prefix: String;
  checkonly domain uml c:Class {namespace=p:Package {},
    kind='Persistent', name=cn};
  enforce domain rdbms t:Table {schema=s:Schema {},name=cn,
    column=cl:Column {name=cn+'_tid', type='NUMBER'},
    key=k:Key {name=cn+'_pk', column=cl}};
  when {
    PackageToSchema(p, s);
  } where {
    prefix = '';
    AttributeToColumn(c, t, prefix);
  }
}
```

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

35

## Atlas Transformation Language (ATL) tutorial with RSM example

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

36

## ATL (1/2)

- ATL: Atlas Transformation Language
- Developed by:
  - LINA (Laboratoire D'Informatique De Nantes Atlantique)
  - Université de Nantes Faculté des Sciences et Techniques
  - Building IRIN
  - 2, rue de la Houssinière, BP 92208
  - 44322 Nantes cedex 3, France
- Proposal to the OMG MOF/QVT RFP.
- Model transformation language
  - Hybrid
    - Declarative => transformations based on simple mappings
    - Imperative => for complex mappings
  - Based on OCL
- Documentation
  - <http://www.eclipse.org/gmt/atl/doc/>

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

37

## ATL (2/2)

- An ATL transformation program is composed of **rules** that define how
  - **source model elements** are **matched** and **navigated**
  - to **create** and **initialize** the **elements of the target models**
- The ATL programs for model to model transformation are called **modules**.
- Composed of
  - **Header**
    - transformation name
    - variables of source and target models
  - **Import**
    - libraries to be imported
  - **Helpers**
    - define (global) variables and functions.
  - **Rules**
    - describe the transformation from a source model to a target model

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

38

## Warning

- To navigate from an element to its attribute,
  - write the name of the element, then “.” and the name of the attribute;
- If an identifier (variable name, metamodel name, model element name, etc.) is in conflict with a keyword,
  - it has to be marked with apostrophes;
- The ATL parser is **case sensitive**. This concerns
  - the **file names**
  - the source **code** itself.

## ATL: Installation

## Installation (1/2)

- Rational Software Modeler (RSM) 6.0
  - Based on Eclipse 3.0
- ADT (ATL Development Tools)
  - Installation guide
    - [http://www.eclipse.org/gmt/atl/doc/ATL\\_Installation\\_Guide\[v0.1\].pdf](http://www.eclipse.org/gmt/atl/doc/ATL_Installation_Guide[v0.1].pdf)
  - NB! Download ADT for Eclipse **3.0** and not 3.1
    - [http://www.eclipse.org/downloads/download.php?file=/technology/gmt/atl/binaries/ADT-20060113/adt-20060113\(Eclipse\\_3.0\).zip](http://www.eclipse.org/downloads/download.php?file=/technology/gmt/atl/binaries/ADT-20060113/adt-20060113(Eclipse_3.0).zip)
    - Unzip `adt-20060113(Eclipse_3.0).zip` into `{RSMInstallDir}\eclipse`
      - `C:\Program Files\IBM\Rational\SDP\6.0\eclipse`

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

41

## Installation (2/2)

- Additional elements to download and install for ADT
  - External libraries not included as part of the standard ADT package
- Download `antlr-2.7.5.jar` from
  - <http://www.antlr.org/download.html>
  - Rename file to `antlr.jar`
  - Copy `antlr.jar` into ...  
`{RSMInstallDir}\eclipse\plugins\org.atl.eclipse.engine_1.0.7\lib`
- Download `mdr-standalone.zip` from
  - <http://mdr.netbeans.org/download/>
  - Unzip into  
`{RSMInstallDir}\eclipse\plugins\org.atl.engine.repositories.mdr4atl_1.0.0\lib`
- The ADT is now installed. In Eclipse it adds
  - Plug-in
  - 2 perspectives
    - ATL perspective
    - Debug perspective

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

42

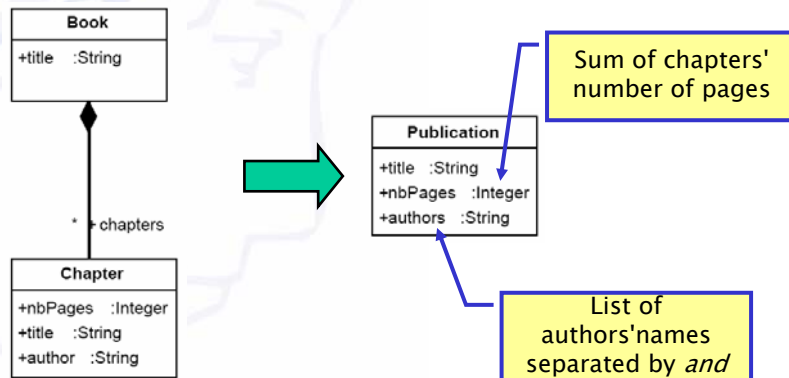

# ATL: Book2Publish example

## Reminder on transformation

## Goal

- Transform instances **Book** into instances of **Publication**

## ATL transformation code

- Header
- Helper
- Rule

- Header

```
module Book2Publication;  
create OUT : Publication from IN : Book;
```

# 1st helper

- Helper
  - To build the authors' list

```
helper context Book!Book def : getAuthors() : String =  
self.chapters->  
  collect(e | e.author)->  
    asSet()->  
      iterate(authorName; acc : String = '' |  
        acc +  
        if acc = ''  
          then authorName  
          else ' and ' + authorName  
        endif);
```

SINTEF

Select the chapters

Get the authors of each chapter

```

helper context Book!Book def : getAuthors() : String =
self.chapters->
  collect(e | e.author)->
    asSet()->
      iterate(authorName; acc : String = '' |
        acc +
        if acc = ''
          then authorName
          else ' and ' + authorName
        endif);

```

Suppress duplicated values

Build the list

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

49

## Iterate on a collection

SINTEF

- To iterate on a collection

```

collection->iterate(elem : Type; acc : Type = <expression> |
  expression-avec-elem-et-acc)

```

- `acc` is an accumulator which gets the initial value
- `elem` is an iterator which iterates on each element of the collection
- For each iteration `expression-avec-elem-et-acc` is
  - Evaluated
  - And then put into `acc`

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

50

## 2nd helper

- Helper
  - To get the total of pages

```
helper context Book!Book def : getNbPages() : Integer =
self.chapters->
  collect(f|f.nbPages)->
    iterate(pages; acc : Integer = 0 |
      acc + pages);
```

## Rules

```
rule Book2Publication {
from
  b : Book!Book (
    b.getNbPages() > 2
  )
to
  out : Publication!Publication (
    title   <- b.title,
    authors <- b.getAuthors(),
    nbPages <- b.getNbPages()
  )
}
```

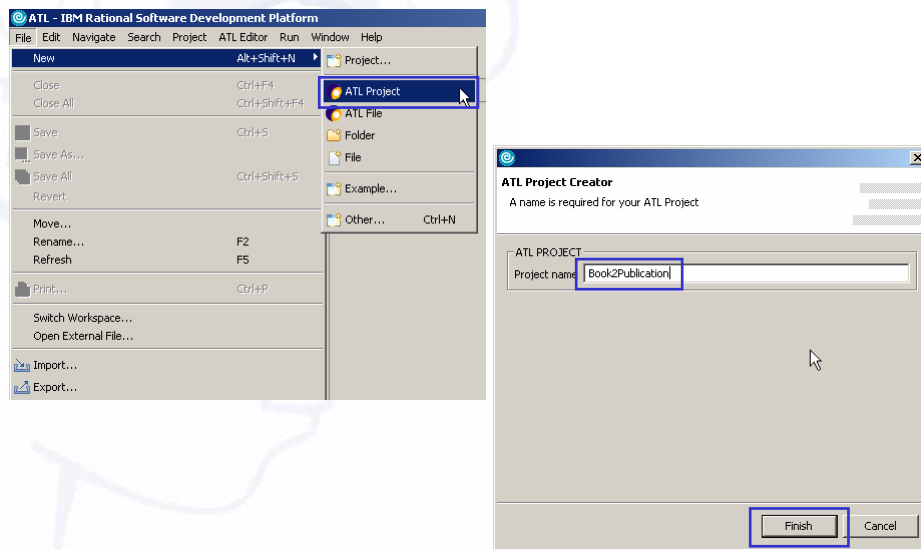

## ATL: RSM

## RSM example steps

1. Create an ATL project **Book2Publication**
2. Create the **Book.emx** metamodel (UML model)
3. Export and import the **Book.emx** metamodel as **Book.ecore**
4. Create the **Publication.emx** metamodel (UML model)
5. Export and import the **Publication.emx** metamodel as **Publication.ecore**
6. Create an ATL file **Book2Publication.atl**
7. Write the ATL transformation
8. Create a source model **theBooks.ecore** containing book instances
9. Configure the ATL transformation
10. Run the ATL transformation

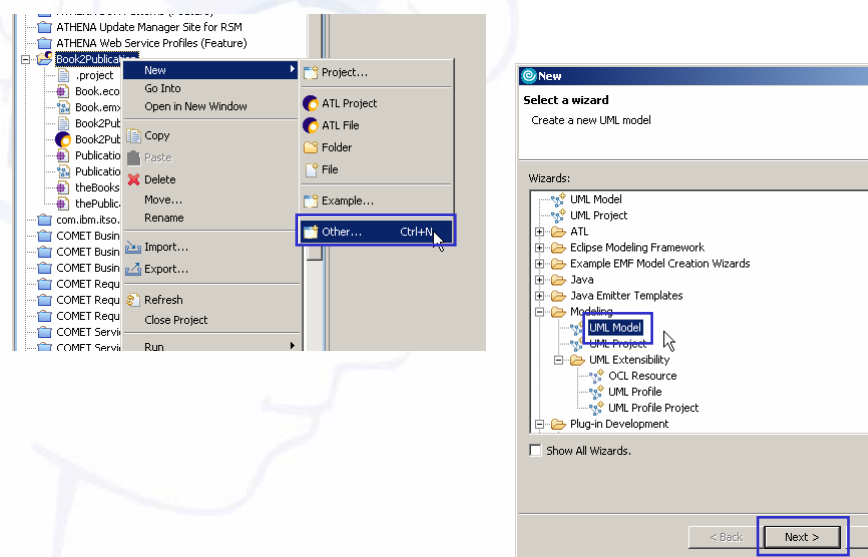

# 1. Create an ATL project

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

55

# 2a. Create the Book metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

56

## 2b. Create the Book metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

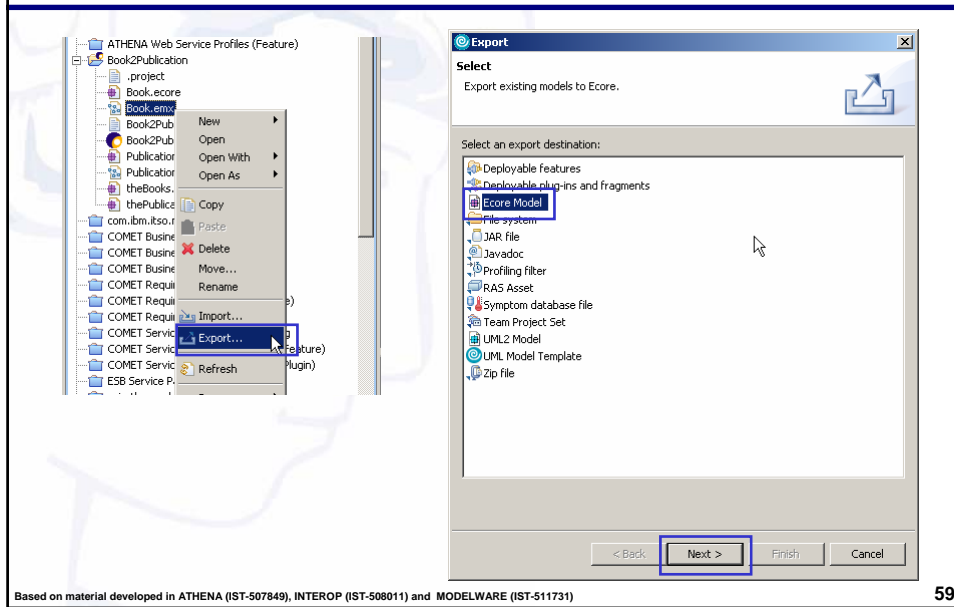

57

## 2c. Create the Book metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

58

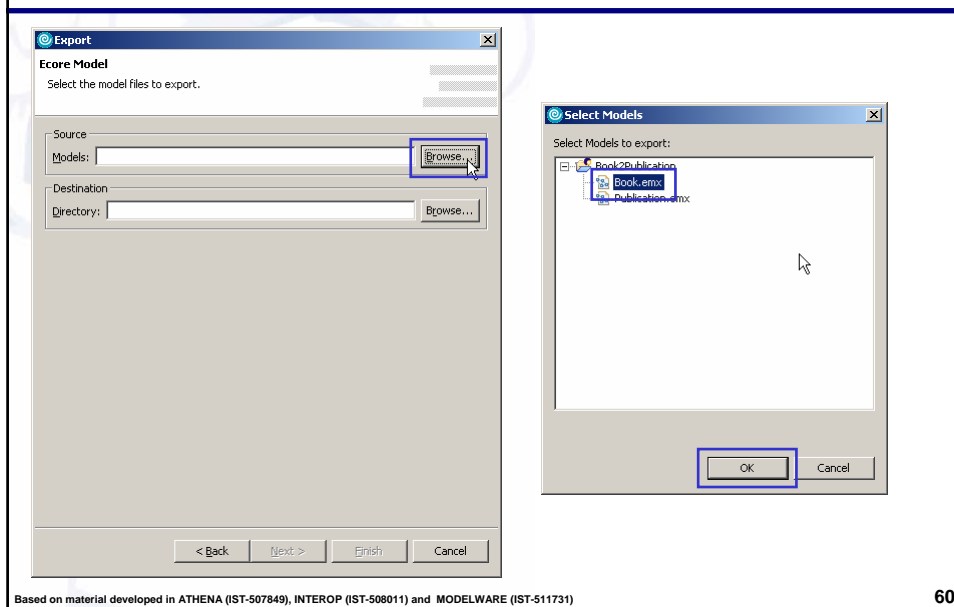

### 3a. Export the Book metamodel as .ecore

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

59

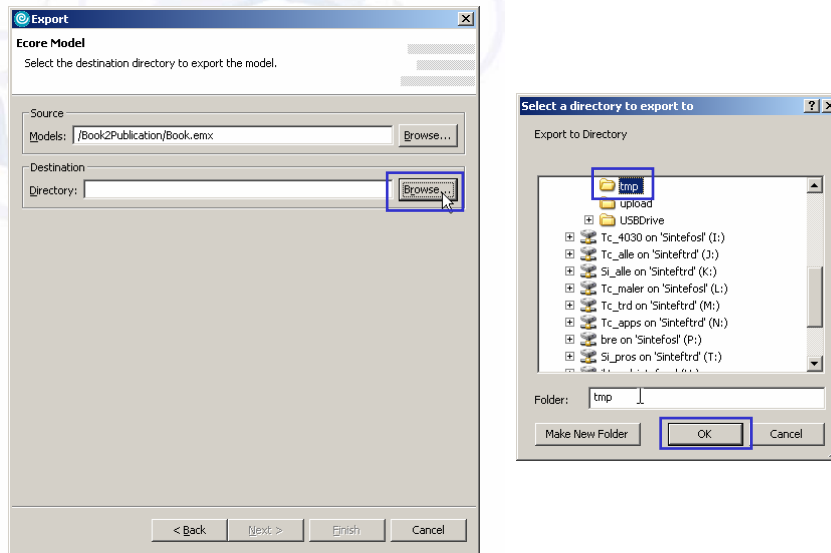

### 3b. Export the Book metamodel as .ecore

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

60

### 3c. Export the Book metamodel as .ecore

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

61

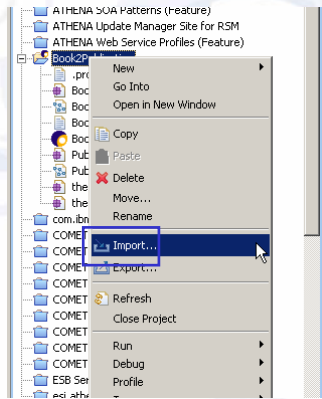

## Book.ecore file

```
<?xml version="1.0" encoding="UTF-8"?>
<ecore:EPackage xmi:version="2.0"
  xmlns:xmi="http://www.omg.org/XMI" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:ecore="http://www.eclipse.org/emf/2002/Ecore" name="Book"
  nsURI="http://Book.ecore" nsPrefix="Book">
  <eclassifiers xsi:type="ecore:EClass" name="Book">
    <eStructuralFeatures xsi:type="ecore:EAttribute" name="title" lowerBound="1"
      eType="ecore:EDatatype http://www.eclipse.org/emf/2002/Ecore#/EString"
      defaultValueLiteral="" />
    <eStructuralFeatures xsi:type="ecore:EReference" name="chapters" upperBound="-1"
      eType="#//Chapter" containment="true" />
  </eclassifiers>
  <eclassifiers xsi:type="ecore:EClass" name="Chapter">
    <eStructuralFeatures xsi:type="ecore:EAttribute" name="title" lowerBound="1"
      eType="ecore:EDatatype http://www.eclipse.org/emf/2002/Ecore#/EString"
      defaultValueLiteral="" />
    <eStructuralFeatures xsi:type="ecore:EAttribute" name="author" lowerBound="1"
      eType="ecore:EDatatype http://www.eclipse.org/emf/2002/Ecore#/EString"
      defaultValueLiteral="" />
    <eStructuralFeatures xsi:type="ecore:EAttribute" name="nbPages" lowerBound="1"
      eType="ecore:EDatatype http://www.eclipse.org/emf/2002/Ecore#/EInt" />
  </eclassifiers>
</ecore:EPackage>
```

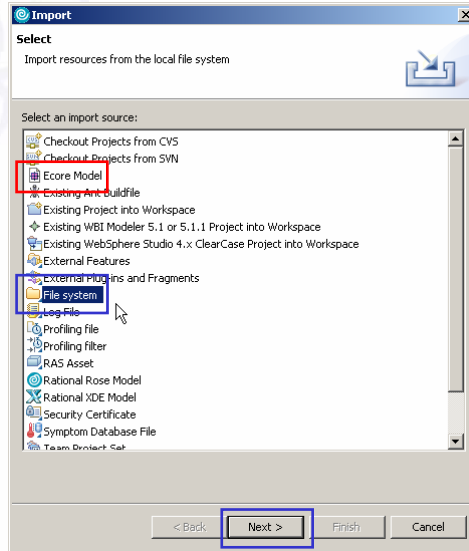

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

62

### 3d. Import the Book metamodel as .ecore

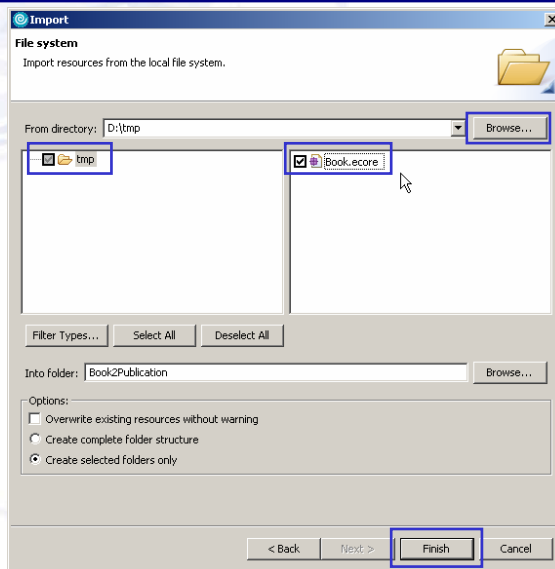

**NB! Choose "File system"  
If you choose "Ecore Model",  
RSM proposes to replace  
your ".emx' model !!!!!**

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

63

### 3e. Import the Book metamodel as .ecore

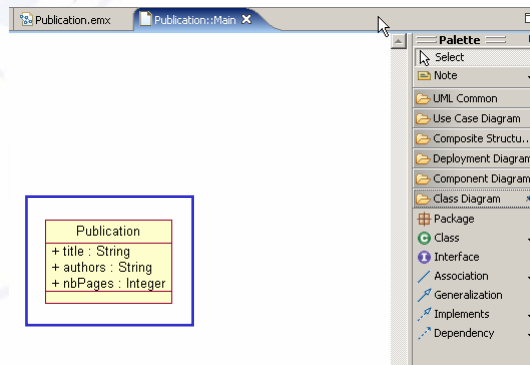

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

64

## 4-5. Create the Publication metamodel and export/import as .ecore

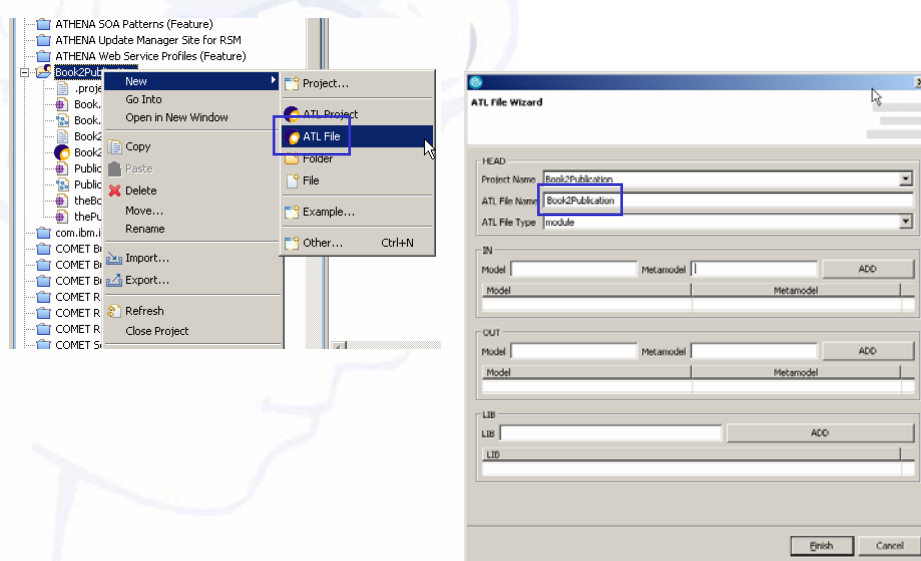

- Follow the same procedure as for the Book metamodel (steps 2 and 3) to create and export/import the **Publication** metamodel as .ecore

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

65

## 6a. Create an ATL file

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

66

## 6b. Set IN metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

67

## 6c. Set OUT metamodel

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

68

## 7. Write the ATL transformation

```
module Book2Publication; -- Module Template
create OUT : Publication from IN : Book ;

helper context Book!Book def : getAuthors() : String =
self.chapters->collect(e | e.author)->
asSet()->
iterate(authorName; acc : String = '' |
acc +
if acc = ''
then authorName
else ' and ' + authorName
endif);

helper context Book!Book def : getNbPages() : Integer =
self.chapters->collect(f | f.nbPages)->
iterate(pages; acc : Integer = 0 |
acc + pages);

rule Book2Publication (
from
b : Book!Book (
b.getNbPages() > 2
)
to
out : Publication!Publication (
title <- b.title,
authors <- b.getAuthors(),
nbPages <- b.getNbPages()
)
)
```

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

69

## 8. Create source model

- Set of book instances `theBooks.ecore`

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<xmi:XMI xmi:version="2.0"
xmlns:xmi="http://www.omg.org/XMI"
xmlns:Book="http://Book.ecore">
<Book:Book title="Easy ATL">
<chapters title="chapter 1" nbPages="5" author="Jean-Pierre"/>
<chapters title="chapter 2" nbPages="6" author="Reyes"/>
</Book:Book >
<Book:Book title="ATL for Dummies">
<chapters title="chapter 1: A" nbPages="13" author="Reyes"/>
<chapters title="chapter 2: T" nbPages="17" author="Arne"/>
<chapters title="chapter 3: L" nbPages="20" author="Jean-Pierre"/>
</Book:Book >
</xmi:XMI>
```

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

70

## 9a. Configure the ATL transformation

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

71

## 9b. Configure the ATL transformation

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

72

## 9c. Configure the ATL transformation

**Name of the source model (IN) and meta-model (Book)**

**The same for the target (OUT, Publication)**

**Set the paths**  
 IN = source model file (**theBooks.ecore**)  
 Book = source metamodel (**Book.ecore**)  
 OUT = target file (**thePublications.ecore**)  
 Publication = target metamodel (**Publication.ecore**)

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

73

## 10. Run the ATL transformation

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

74

# Result: thePublications.ecore

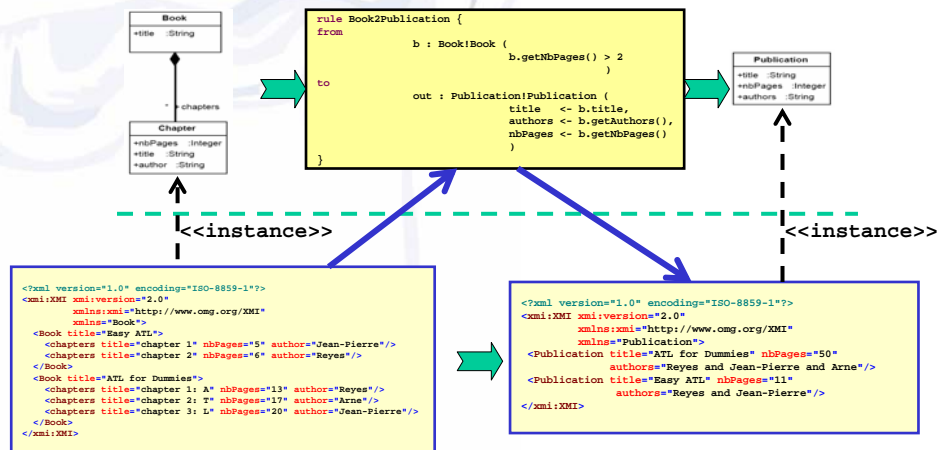

```

<?xml version="1.0" encoding="ISO-8859-1"?>
<xmi:XMI xmi:version="2.0" xmlns:xmi="http://www.omg.org/XMI"
  xmlns:Publication="http://Publication.ecore">
  <Publication:Publication title="ATL for Dummies"
    authors="Reyes and Jean-Pierre and Arne"
    nbPages="50"/>
  <Publication:Publication title="Easy ATL"
    authors="Reyes and Jean-Pierre"
    nbPages="11"/>
</xmi:XMI>
    
```

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)

# To summarize

Based on material developed in ATHENA (IST-507849), INTEROP (IST-508011) and MODELWARE (IST-511731)
