## HandleNett

### **Description**

The main purpose of this project is to provide users a more simple and convenient way to make grocery shopping, by using an application. With this app the customers can make shopping list and buy them online. Those groceries user shopped, would be picked up by the user at the appointed time. This app would make users to spend less time and encourage them to use their local facilities. Finally, the app has also potential to reduce stocked goods of each store.

### **Positives**

1. Good concept that directly related to people's daily life.
2. Detailed consideration for design.
3. It is nice to focus on the elderly as user group since they seem to be able to benefit from this kind of application. Also narrowing down the target group helps the design process.

### **Suggestions for improvement**

1. Stores already have the information about different items sold and in what quantity. So reducing the amount of groceries might be hard to do.
2. Difficult to realize. Need permissions to access to databases. (what benefits can the stores get from the app?)
3. The application is quite similar to already existing applications, like kolonial.no etc. Maybe focus on the differences between your application and similar applications.
