## UNIVERSITY OF OSLO

# Faculty of Mathematics and Natural Sciences 

Exam in INF5830 - Natural language processing<br>Day of exam: 9 December 2013<br>Exam hours: at 09:00-4 hours<br>This examination paper consists of 4 pages including this.<br>Appendices: Statistical table - 4 pages<br>Permitted materials: None

Make sure that your copy of this examination paper
is complete before answering.

- You may answer in English, Norwegian, Danish or Swedish.
- You should answer all questions. The weight of the various questions are indicated.
- You should read through the whole set to see whether anything is unclear so that you can ask your questions to the teachers when they arrive.
- If you think some assumptions are missing, make your own and explain them!

## 1 Accuracy and estimation (15\%)

Kim is testing a classifier for entailment vs. non-entailment on a test set of 400 items. The results may be summarized in the following table.

|  |  | Test results |  |
| :--- | :--- | ---: | ---: |
|  |  | entailment | non-entailment |
| Reference | entailment | 90 | 30 |
|  | non-entailment | 10 | 270 |

(a) What is the accuracy of the classifier on this test set?
(b) Assume the test set is a random sample from a large population. Estimate an interval with a $95 \%$ confidence level for the accuracy of the classifier on the population.

## 2 Dependency syntax and parsing (20\%)

(a) Draw the dependency graph for the sentence
(i) A hearing is scheduled on the issue today.
here provided in the so-called CoNLL-format:

| 1 | A | a | DT | DT | 2 | NMOD |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | hearing | hearing | NN | NN | 3 | SBJ |
| 3 | is | be | VBZ | VBZ | 0 | ROOT |
| 4 | scheduled | schedule | VBD | VBD | 3 | VC |
| 5 | on | on | IN | IN | 2 | PP |
| 6 | this | this | DT | DT | 7 | NMOD |
| 7 | issue | issue | NN | NN | 5 | PCOMP |
| 8 | today | today | NN | NN | 4 | TMP |
| 9 | . | . | . | . | 3 | PUNC |

(b) Choose three different dependencies in the graph above and use these to present three different criteria for syntactic head status, i.e. you should provide at least one criterion per dependency.
(c) Nivre's arc eager algorithm operates with four parse transitions, two of which are parameterized by the dependency relation $r$ : Shift, Reduce, Left-Arc ${ }_{r}$, Right-Arc $_{r}$
(i) Show the transition sequence that results from applying the algorithm to the sentence in (a) above, at each step providing the transition employed (Shift, Reduce, Left- $\mathrm{Arc}_{r}, \operatorname{Right}-\mathrm{Arc}_{r}$ ), as well as the contents of the stack and queue.
(ii) Does the algorithm terminate successfully? Why/why not?

## 3 Semantic role labeling (20\%)

(a) "In most languages, it is often the case that subjects correspond to agents". Comment on this statement in the light of the sentence in (2a) above. What does this tell you more generally about the relationship between syntax and semantics?
(b) Briefly describe Dowty's theory of semantic roles. What is the Argument Selection Principle and how does it account for the analysis of our example sentence in (2a)?
(c) We want to improve our semantic role system by including generalizations like the one expressed in (3a) above. We therefore wish to implement the Parse Tree Path feature first described in Gildea \& Jurafsky (2002). Consider the simple sentence in (ii) below:
(ii) The man ate cake

Provide a phrase structure tree for this sentence and explain how to extract the path for the two arguments man and cake. Could we extract the same type of information from a dependency analysis of the same sentence?

## 4 Decision trees (10\%)

(The following example is of course simplified.) Kim is training an entailment classifier on 25 training items. Each item consists of a premise, P, and a hypothesis, H. The test items belong to one of two classes: Entailment or Nonentailment. Kim has decided to use two features only, whether the premise contains the word "not" and whether the hypothesis contains "not". The 25 observations are summed up in the following table.

| P contains "not" | H contains "not" | class | Number of obs. |
| :---: | :---: | :---: | :---: |
| yes | yes | entailment | 4 |
| yes | no | non-entail | 6 |
| no | yes | non-entail | 3 |
| no | no | entailment | 12 |
| all other combinations |  | 0 |  |

(a) Construct a decision tree classifier from these training data. You do not have to consider information gain or other measures to select the first feature for splitting.
(b) Evaluate the classifier on the training data. What is its accuracy, precision and recall?

## 5 Classifiers (35\%)

(a) Give a short description of the main principles underlying a Naive Bayes classifier. You do not have to discuss the differences between the binomial and the multinomial approach to text classification.
(b) Kim is training a Naive Bayes classifier on the same training data as in exercise (4). How will this classifier classify an observation where H contains "not", while P does not contain "not"? State reasons for your answer.
(c) Given the training data, will you say that this task is linearly separable? State reasons for your answer.

END

# STATISTICAL TABLES 

Cumulative normal distribution

Critical values of the $\boldsymbol{t}$ distribution
Critical values of the $F$ distribution
Critical values of the chi-squared distribution

Table A. 1

## Cumulative Standardized Normal Distribution

$A(z)$ is the integral of the standardized normal distribution from $-\infty$ to $z$ (in other words, the area under the curve to the left of $z$ ). It gives the probability of a normal random variable not being more than $z$ standard deviations above its mean. Values of $z$ of particular importance:

| $z$ | $A(z)$ |  |
| :---: | :---: | :--- |
| 1.645 | 0.9500 | Lower limit of right 5\% tail |
| 1.960 | 0.9750 | Lower limit of right $2.5 \%$ tail |
| 2.326 | 0.9900 | Lower limit of right $1 \%$ tail |
| 2.576 | 0.9950 | Lower limit of right $0.5 \%$ tail |
| 3.090 | 0.9990 | Lower limit of right $0.1 \%$ tail |
| 3.291 | 0.9995 | Lower limit of right $0.05 \%$ tail |

| $z$ | 0.00 | 0.01 | 0.02 | 0.03 | 0.04 | 0.05 | 0.06 | 0.07 | 0.08 | 0.09 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
